ABSTRACT

We consider the multiplication operator, $M$, in Sobolev spaces with respect to general measures and give a characterization for $M$ to be bounded, in terms of sequentially dominated measures. This has important consequences for the asymptotic behaviour of Sobolev orthogonal polynomials. Also, we study properties of Sobolev spaces with respect to measures.

Key words: Sobolev Spaces, weights, orthogonal polynomials.

List of Symbols:

The article is written using AMSTex, so the symbols we use make no confusion. We may send you by electronic mail the AMSTex file of the article.
1. Introduction.

Weighted Sobolev spaces are an interesting topic in many fields of mathematics (see e.g. [HKM], [K], [Ku], [KO], [KS] and [T]). In [ELW1], [EL] and [ELW2] the authors study some examples of Sobolev spaces with respect to general measures instead of weights, in relation with ordinary differential equations and Sobolev orthogonal polynomials. The papers [RARP1] and [RARP2] are the beginning of a theory of Sobolev spaces with respect to general measures. We are interested in the relationship between this topic and Sobolev orthogonal polynomials.

Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a vectorial Borel measure in $\mathbb{R}$ with $\Delta := \bigcup_{j=0}^k \text{supp} \mu_j$. The Sobolev norm of a function $f$ of class $C^k(\mathbb{R})$ in $W^{k,p}(\Delta, \mu)$ is defined by

$$||f||_{W^{k,p}(\Delta, \mu)} := \sum_{j=0}^k \int |f^{(j)}|^p d\mu_j.$$ 

We talk about Sobolev norm although it can be a seminorm; in this case we will take equivalence classes, as usual.

We say that $\mu \in \mathcal{M}$ if every polynomial belongs to $L^1(\mu_0) \cap L^1(\mu_1) \cap \cdots \cap L^1(\mu_k)$. Therefore if $\mu \in \mathcal{M}$, every polynomial belongs to $L^p(\mu_0) \cap L^p(\mu_1) \cap \cdots \cap L^p(\mu_k)$ for any $1 \leq p < \infty$. Obviously, every $\mu \in \mathcal{M}$ is finite. If $\Delta$ is a compact set, we have $\mu \in \mathcal{M}$ if and only if $\mu$ is finite. If $\mu \in \mathcal{M}$, we denote by $P^{k,p}(\Delta, \mu)$ the completion of polynomials $P$ with the norm of $W^{k,p}(\Delta, \mu)$. By a theorem in [LP] we know that the zeroes of the Sobolev orthogonal polynomials with respect to the scalar product in $W^{k,2}(\Delta, \mu)$ are contained in the disk $\{z : |z| \leq 2||\mu||\}$, where the multiplication operator $(Mf)(x) = xf(x)$ is considered in the space $P^{k,2}(\Delta, \mu)$. Consequently, the set of the zeroes of the Sobolev orthogonal polynomials is bounded if the multiplication operator is bounded. The location of these zeroes allows to prove results on the asymptotic behaviour of Sobolev orthogonal polynomials (see [LP]).

In [LP] also appears the following result: If $\Delta$ is a compact set and $\mu$ is a finite measure in $\Delta$ sequentially dominated, then $M$ is a bounded operator in $P^{k,2}(\Delta, \mu)$, where the vectorial measure $\mu$ is sequentially dominated if $\#\text{supp} \mu_0 = \infty$ and $d\mu_j = f_j d\mu_{j-1}$ with $f_j$ bounded for $1 \leq j \leq k$. In that paper the authors ask for other conditions on $M$ to be bounded.

It is not difficult to see that the multiplication operator can be bounded when the vectorial measure is not sequentially dominated. In Section 4 below and in [RARP2] other conditions are given in order to have the boundedness of $M$.

Now, let us state the main results here. We refer to the definitions in sections 2 and 4. In the paper, the results are numbered according to the section where they are proved.

Here we obtain the following characterization for the boundedness of the multiplication operator in terms of comparable norms. Observe that this characterization is closely related to sequentially dominated measures, since we say that a vectorial measure $\mu$ belongs to the class $\text{ESD}$ (extended sequentially dominated) if and only if $d\mu_j = f_j d\mu_{j-1}$ with $f_j$ bounded for $1 \leq j \leq k$.

**Theorem 4.1.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Then, the multiplication operator is bounded in $P^{k,p}(\Delta, \mu)$ if and only if there exists a vectorial measure $\mu' \in \text{ESD}$ such that the Sobolev norms in $W^{k,p}(\Delta, \mu)$ and $W^{k,p}(\Delta, \mu')$ are comparable on $P$. Furthermore, we can choose $\mu' = (\mu'_0, \ldots, \mu'_k)$ with $\mu'_j := \mu_j + \mu_{j+1} + \cdots + \mu_k$.

* Research partially supported by a grant from DGES (MEC), Spain.
We have also necessary conditions and sufficient conditions for $M$ to be bounded. The following are the most important.

**Theorem 4.3.** Let us consider $1 \leq p < \infty$ and a finite vectorial measure $\mu$ with $\Delta$ a compact set. Assume that $(\Delta^{ad}, \mu^{ad}) \in C_0$ and that for each $1 \leq j \leq k$ we have $\mu_j(\Delta \setminus (J_{j-1} \cup K_{j-1})) = 0$, where $K_{j-1}$ is a finite union of compact intervals contained in $U^{(j-1)}$, and $J_{j-1}$ is a measurable set with $d\mu_j = f_j d\mu_{j-1}$ in $J_{j-1}$ and $f_j$ bounded. Then the multiplication operator is bounded in $P^k$.

**Theorem 4.4.** Let us consider $1 < p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure such that $\Delta$ is a compact set and there exist $\eta_0 > 0$, $x_0 \in \mathbb{R}$ and $0 < k_0 \leq k$ with $\mu_j([x_0 - \eta_0, x_0 + \eta_0]) = 0$ for $k_0 < j \leq k$. Let us assume that $x_0$ is neither right nor left $(k_0 - 1)$-regular. If $\mu_{k_0}(\{x_0\}) > 0$ and $\mu_{k_0-1}(\{x_0\}) = 0$, then the multiplication operator is not bounded in $P^{k}$.

**Theorem 4.5.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \mathbb{R}$, $c > 0$, $0 \leq k_0 < k$ and an open neighbourhood $U$ of $x_0$ such that

$$d\mu_{j+1}(x) \leq c|x - x_0|^p d\mu_j(x),$$

for $x \in U \setminus \{x_0\}$ and $k_0 \leq j < k$. If there exists $i > k_0$ with $\mu_i(\{x_0\}) > 0$ and $\mu_{i-1}(\{x_0\}) = 0$, then the multiplication operator is not bounded in $P^{k}$.

In order to prove these results we also obtain some results on Sobolev spaces with respect to measures, which are interesting by themselves.

**Theorem 3.1.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \mathbb{R}$ and $0 \leq k_0 \leq k$ with $\mu_{k_0}(\{x_0\}) = 0$ and satisfying the following property if $k_0 < k$: there exist an open neighbourhood $U$ of $x_0$ and $c > 0$ such that

$$d\mu_{j+1}(x) \leq c|x - x_0|^p d\mu_j(x),$$

for $x \in U$ and $k_0 \leq j < k$. Let us define

$$\nu := (0, \ldots, 0, \alpha_{k_0} \delta_{x_0}, \alpha_{k_0+1} \delta_{x_0}, \ldots, \alpha_k \delta_{x_0})$$

and $N := \#\{k_0 \leq j \leq k : \alpha_j > 0\}$. Given a Cauchy sequence $\{q_n\} \subset P$ in $W^{k,p}(\Delta, \mu)$ and $u_{k_0}, \ldots, u_k \in \mathbb{R}$ there exists a Cauchy sequence $\{r_n\} \subset P$ in $W^{k,p}(\Delta, \mu)$ with $\lim_{n \to \infty} ||q_n - r_n||_{W^{k,p}(\Delta, \mu)} = 0$ and $r^{(j)}_n(x_0) = u_j$ for $k_0 \leq j \leq k$. Consequently $P^{k,p}(\Delta, \mu + \nu)$ is isomorphic to $P^{k,p}(\Delta, \mu) \times \mathbb{R}_N$.

**Theorem 3.3.** Let us consider $1 < p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a vectorial measure such that there exist $\eta_0 > 0$, $x_0 \in \mathbb{R}$ and $0 < k_0 \leq k$ with $\mu_j([x_0 - \eta_0, x_0 + \eta_0]) < \infty$ for $0 \leq j \leq k_0$ and $\mu_j([x_0 - \eta_0, x_0 + \eta_0]) = 0$ for $k_0 < j \leq k$ (if $k_0 < k$). Let us assume that $x_0$ is neither right nor left $(k_0 - 1)$-regular and that $\mu_{k_0-1}(\{x_0\}) = 0$. Then, for any $0 < \eta \leq \eta_0$, there is no positive constant $c_1$ with

$$c_1 |f^{(k_0-1)}(x_0)| \leq \|f\|_{W^{k,p}(\Delta, \mu)},$$

for every $f \in C^\infty_c([x_0 - \eta, x_0 + \eta])$.

If we have also that $\mu$ is finite and $\Delta$ is a compact set, then there is no positive constant $c_2$ with

$$c_2 |q^{(k_0-1)}(x_0)| \leq \|q\|_{W^{k,p}(\Delta, \mu)},$$

for every $q \in P$.

We also obtain results which allow to decide in many cases when two norms are comparable. We have also localization results on the multiplication operator. Now we present the notation we use.
Notation. In the paper $k \geq 1$ denotes a fixed natural number; obviously $W^{0,p}(\Delta,\mu) = L^p(\Delta,\mu)$. All the measures we consider are Borel and positive on $\mathbb{R}$; if a measure is defined on a proper subset $E \subset \mathbb{R}$, we define it on $\mathbb{R} \setminus E$ as the zero measure. Also, all the weights are non-negative Borel measurable functions defined on $\mathbb{R}$. If the measure does not appear explicitly, we mean that we are using Lebesgue measure. We always work with measures which satisfy the decomposition $dp_\mu = d(\mu_j)_s + d(\mu_j)_ac = d(\mu_j)_s + h \, dx$, where $(\mu_j)_s$ is singular with respect to Lebesgue measure, $(\mu_j)_ac$ is absolutely continuous with respect to Lebesgue measure and $h$ is a Lebesgue measurable function (which can be infinite in a set of positive Lebesgue measure); obviously the Radon-Nikodym Theorem gives that every $\sigma$-finite measure belongs to this class. Given a vectorial measure $\mu$ and a closed set $E$, we denote by $W^{k,p}(E,\mu)$ the space $W^{k,p}(\Delta \cap E,\mu|_E)$. We denote by supp $\nu$ the support of the measure $\nu$. If $A$ is a Borel set, $|A|$, $\chi_A$, $\overline{A}$, int($A$) and $\#A$ denote, respectively, the Lebesgue measure, the characteristic function, the closure, the interior and the cardinality of $A$. By $f^{(j)}$ we mean the $j$-th distributional derivative of $f$. $P$ and $P_n$ denote respectively the set of polynomials and the set of polynomials with degree less than or equal to $n$. We say that an $n$-dimensional vector satisfies a one-dimensional property if each coordinate satisfies this property. Finally, the constants in the formulae can vary from line to line and even in the same line.

The outline of the paper is as follows. Section 2 presents most of the definitions we need to state our results. We prove some useful results on Sobolev spaces in Section 3. Section 4 is dedicated to the proof of the multiplication operator.

Acknowledgements. I would like to thank the referees for their careful reading of the manuscript.

2. Definitions and results.

Obviously one of our main problems is to define correctly the space $W^{k,p}(\Delta,\mu)$. There are two natural definitions:

1. $W^{k,p}(\Delta,\mu)$ is the biggest space of (classes of) functions $f$ which are regular enough to have $\|f\|_{W^{k,p}(\Delta,\mu)} < \infty$.

2. $W^{k,p}(\Delta,\mu)$ is the closure of a good set of functions (e.g. $C^\infty(\mathbb{R})$ or $P$) with the norm $\|\cdot\|_{W^{k,p}(\Delta,\mu)}$.

However both approaches have serious difficulties:

We consider first the approach (1). It is clear that the derivatives $f^{(j)}$ must be distributional derivatives in order to have a complete Sobolev space. Therefore we need to restrict the measures $\mu$ to a class of $p$-admissible measures (see Definition 8). Roughly speaking $\mu$ is $p$-admissible if $(\mu_j)_s$, for $0 < j \leq k$, is concentrated on the set of points where $f^{(j)}$ is continuous, for every function $f$ of the space, because otherwise $f^{(j)}$ is determined, up to zero-Lebesgue measure sets (see definitions 4 and 9 below). This will force $(\mu_j)_s$ to be identically zero. However, there will be no restriction on the support of $(\mu_j)_s$.

This reasonable approach excludes norms appearing in the theory of Sobolev orthogonal polynomials. Even if we work with the simpler case of the weighted Sobolev spaces $W^{k,p}(\Delta,\mu)$ (measures without singular part) we must impose that $u_j$ belongs to the class $B_p$ (see Definition 2 below) in order to have a complete weighted Sobolev space (see [KO] and [RARP1]).

The approach (2) is simpler: we know that the completion of every normed space exists (e.g. $(C^\infty(\mathbb{R}), \|\cdot\|_{W^{k,p}(\Delta,\mu)})$ or $(P, \|\cdot\|_{W^{k,p}(\Delta,\mu)})$). We have two difficulties. The first one is evident: we do not have an explicit description of the Sobolev functions as in (1) (in Section 4 of [RARP2] there are several theorems which show that both definitions of Sobolev space are the same for $p$-admissible measures). The second problem is worse: The completion of a normed space is by definition a set of equivalence classes of Cauchy sequences. In many cases this completion is not a function space (see Theorem 3.1 below and its Remark).

However, since we need to work with the multiplication operator in $P^{k,p}(\Delta,\mu)$, we have to choose this second approach if $\mu$ is not $p$-admissible.

First of all, we explain the definition of generalized Sobolev space in [RARP1]. We start with some preliminary definitions.
Definition 1. We say that two positive functions \( u, v \) are comparable on the set \( A \) if there are positive constants \( c_1, c_2 \) such that \( c_1 v(x) \leq u(x) \leq c_2 v(x) \) for almost every \( x \in A \). Since measures and norms are functions on measurable sets and vectors, respectively, we can talk about comparable measures and comparable norms. We say that two vectorial weights or vectorial measures are comparable if each component is comparable.

In what follows, the symbol \( a \asymp b \) means that \( a \) and \( b \) are comparable for \( a \) and \( b \) functions, measures or norms.

Obviously, the spaces \( L^p(A, \mu) \) and \( L^p(A, \nu) \) are the same and have comparable norms if \( \mu \) and \( \nu \) are comparable on \( A \). Therefore, in order to obtain our results we can change a measure \( \mu \) to any comparable measure \( \nu \).

Next, we shall define a class of weights which plays an important role in our results.

Definition 2. If \( 1 \leq p < \infty \), we say that a weight \( w \) belongs to \( B_p([a, b]) \) if and only if
\[
  w^{-1} \in L^{1/(p-1)}([a, b])
\]
Also, if \( J \) is any interval we say that \( w \in B_p(J) \) if \( w \in B_p(I) \) for every compact interval \( I \subseteq J \). We say that a weight belongs to \( B_p(J) \), where \( J \) is a union of disjoint intervals \( \cup_{i \in A} J_i \), if it belongs to \( B_p(J_i) \), for \( i \in A \).

Observe that if \( v \geq w \) in \( J \) and \( w \in B_p(J) \), then \( v \in B_p(J) \).

The class \( B_p(\mathbb{R}) \) contains the classical \( A_p(\mathbb{R}) \) weights appearing in harmonic analysis (see [Mu1] or [GR]). The classes \( B_p(\mathbb{R}^n) \), with \( \mathbb{R}^n \subseteq \mathbb{R}^n \), and \( A_p(\mathbb{R}^n) \) \((1 < p < \infty)\) have been used in other definitions of weighted Sobolev spaces in [KO] and [K] respectively.

Definition 3. We denote by \( AC([a, b]) \) the set of functions absolutely continuous on \([a, b]\), i.e. the functions \( f \in C([a, b]) \) such that \( f(x) - f(a) = \int_a^x f'(t) \, dt \) for all \( x \in [a, b] \). If \( J \) is any interval, \( AC_{loc}(J) \) denotes the set of functions absolutely continuous on every compact subinterval of \( J \).

Definition 4. Let us consider \( 1 \leq p < \infty \) and a vectorial measure \( \mu = (\mu_0, \ldots, \mu_k) \) with absolutely continuous part \( w = (w_0, \ldots, w_k) \). For \( 0 \leq j \leq k \) we define the open set
\[
  \Omega_j := \{ x \in \mathbb{R} : \exists \text{ an open neighbourhood } V \text{ of } x \text{ with } w_j \in B_p(V) \}.
\]
Observe that we always have \( w_j \in B_p(\Omega_j) \) for any \( 1 \leq p < \infty \) and \( 0 \leq j \leq k \). In fact, \( \Omega_j \) is the greatest open set \( U \) with \( w_j \in B_p(U) \). Obviously, \( \Omega_j \) depends on \( w \) and \( p \), although \( p \) and \( \mu \) do not appear explicitly in the symbol \( \Omega_j \). Applying Hölder’s inequality it is easy to check that if \( f^{(j)} \in L^p(\Omega_j, w_j) \) with \( 1 \leq j \leq k \), then \( f^{(j)} \in L^{1/(p-1)}(\Omega_j) \) and \( f^{(j-1)} \in AC_{loc}(\Omega_j) \).

Hypothesis. From now on we assume that \( w_j \) is identically 0 on the complement of \( \Omega_j \).

Remark. We need this hypothesis in order to have complete Sobolev spaces (see [KO] and [RARP1]). This hypothesis is satisfied, for example, if we can modify \( w_j \) in a set of zero Lebesgue measure in such a way that there exists a sequence \( \alpha_n \searrow 0 \) with \( w_j^{-1}(\{\alpha_n, \infty\}) \) open for every \( n \). If \( w_j \) is lower semicontinuous, then this condition is satisfied.

The following definitions also depend on \( w \) and \( p \), although \( w \) and \( p \) do not appear explicitly.

Let us consider \( 1 \leq p < \infty \) and \( \mu_0, \mu_1 \) measures in \((a, b]\) with \( w_1 := dp_1/\rho x \). Then there exists a positive constant \( c \) such that
\[
  \left\| \int_x^b g(t) \, dt \right\|_{L^p([a, b], \mu_0)} \leq c \| g \|_{L^p([a, b], \mu_1)}
\]
for any measurable function \( f \) in \((a, b]\), if and only if
\[
  \sup_{a < r < b} \mu_0([a, r]) \| w_1^{-1} \|_{L^{1/(p-1)}([r, b])} < \infty.
\]
Definition 5. A vectorial measure \( \mu = (\mu_0, \ldots, \mu_k) \) is a right completion of a vectorial measure \( \mu = (\mu_0, \ldots, \mu_k) \) with respect to \( y \), if \( \mu_k := \mu_k \) and there is an \( \varepsilon > 0 \) such that \( \mu_j := \mu_j \) on the complement of \( (y, y + \varepsilon] \) and 
\[ \bar{\mu}_j := \mu_j + \tilde{\mu}_j, \quad \text{on } (y, y + \varepsilon] \text{ for } 0 \leq j < k, \]
where \( \tilde{\mu}_j \) is any measure satisfying:

1. \( \mu_j((y, y + \varepsilon]) \subset \mathbb{R} \) is satisfied:

\[
\Lambda_p(\nu, \sigma) := \sup_{y < r < y + \varepsilon} \nu((y, r)) \left\| \frac{d\sigma}{dx} \right\|^{-1}_{L^{1/(p-1)}([y, y+\varepsilon])},
\]

where the Muckenhoupt inequality guarantees that if \( f^{(j)} \in L^p(\mu_j) \) and \( f^{(j+1)} \in L^p(\bar{\mu}_{j+1}) \), then \( f^{(j)} \in L^p(\mu_j) \). If we work with absolutely continuous measures, we also say that a vectorial weight \( \bar{\mu} \) is a completion of \( \mu \) (or \( \nu \)).

Example. It can be shown that the following construction is always a completion: we choose \( \tilde{w}_j := 0 \) if \( \bar{w}_{j+1} \notin B_p((y, y + \varepsilon]) \); if \( \bar{w}_{j+1} \in B_p((y, y + \varepsilon]) \) we set \( \tilde{w}_j(x) := 1 \) in \( [y, y + \varepsilon] \); and if \( \bar{w}_{j+1} \notin B_p((y, y + \varepsilon]) \) we take \( \tilde{w}_j(x) := 1 \) for \( x \in [y + \varepsilon/2, y + \varepsilon] \), and

\[ \tilde{w}_j := \frac{d}{dx} \left\{ \int_x^{y+\varepsilon} \bar{w}_{j+1}^{-p/(p-1)} \right\} \quad \text{if } 1 < p < \infty, \]

\[ \tilde{w}_j := \left[ \frac{\| \bar{w}_{j+1} \|_{L^\infty([x,y+\varepsilon])}^{-1}}{\| \bar{w}_{j+1} \|_{L^\infty([x,y+\varepsilon])}} \right]^{-1} + \frac{d}{dx} \left( \left[ \frac{\| \bar{w}_{j+1} \|_{L^\infty([x,y+\varepsilon])}^{-1}}{\| \bar{w}_{j+1} \|_{L^\infty([x,y+\varepsilon])}} \right]^{-1} \right) \quad \text{if } p = 1, \]

for \( x \in (y, y + \varepsilon/2) \).

Remarks.

1. We can define a left completion of \( \mu \) with respect to \( y \) in a similar way.
2. If \( \bar{w}_{j+1} \in B_p((y, y + \varepsilon]) \), then \( \Lambda_p(\tilde{\mu}_j, \bar{w}_{j+1}) < \infty \) for any measure \( \tilde{\mu}_j \) with \( \tilde{\mu}_j((y, y + \varepsilon]) < \infty \). In particular, \( \Lambda_p(1, \bar{w}_{j+1}) < \infty \).
3. If \( \mu, \nu \) are comparable measures, \( \bar{\mu} \) is a right completion of \( \nu \) if and only if it is comparable to a right completion \( \bar{\nu} \) of \( \mu \).
4. If \( \mu, \nu \) are two vectorial measures with the same absolutely continuous part, then \( \bar{\mu} \) is a right completion of \( \mu \) if and only if it is a right completion of \( \nu \).

Definition 6. For \( 1 \leq p < \infty \) and a vectorial measure \( \mu \), we say that a point \( y \in \mathbb{R} \) is right \( j \)-regular (respectively, left \( j \)-regular), if there exist \( \varepsilon > 0 \), a right completion \( \bar{\mu} \) (respectively, left completion) of \( \mu \) and \( j < i \leq k \) such that \( \bar{w}_i \in B_p((y, y + \varepsilon]) \) (respectively, \( B_p((y-\varepsilon, y]) \)). Also, we say that a point \( y \in \mathbb{R} \) is \( j \)-regular, if it is right and left \( j \)-regular.

Remarks.

1. A point \( y \in \mathbb{R} \) is right \( j \)-regular (respectively, left \( j \)-regular), if at least one of the following properties is satisfied:

(a) There exist \( \varepsilon > 0 \) and \( j < i \leq k \) such that \( w_i \in B_p((y, y + \varepsilon]) \) (respectively, \( B_p((y-\varepsilon, y]) \)). Here we have chosen \( \bar{w}_j = 0 \).

(b) There exist \( \varepsilon > 0, j < i \leq k, \alpha > 0, \) and \( \delta < (i-j)p - 1 \), such that

\[ w_i(x) \geq \alpha |x - y|^\delta, \quad \text{for almost every } x \in [y, y + \varepsilon] \]

(respectively, \( [y - \varepsilon, y] \)). See Lemma 3.4 in [RARP1].

2. If \( y \) is right \( j \)-regular (respectively, left), then it is also right \( i \)-regular (respectively, left) for each \( 0 \leq i < j \).

3. We can take \( i = j + 1 \) in this definition since by the second remark after Definition 5 we can choose \( \bar{w}_i = w_i + 1 \in B_p((y, y + \varepsilon]) \) for \( j < i < j + 1 \), if \( j + 1 < i \).

4. If \( \mu, \nu \) are two vectorial measures with the same absolutely continuous part, then \( y \) is right \( j \)-regular (respectively, left) with respect to \( \mu \) if and only if it is right \( j \)-regular (respectively, left) with respect to \( \nu \).
When we use this definition we think of a point \{b\} as the union of two half-points \{b^+\} and \{b^-\}. With this convention, each one of the following sets

\[(a, b) \cup (b, c) \cup \{b^+\} = (a, b) \cup [b^+, c) \neq (a, c),
(a, b) \cup (b, c) \cup \{b^-\} = (a, b^-] \cup (b, c) \neq (a, c),\]

has two connected components, and the set

\[(a, b) \cup (b, c) \cup \{b^-\} \cup \{b^+\} = (a, b) \cup (b, c) \cup \{b\} = (a, c)\]
is connected.

We only use this convention in order to study the sets of continuity of functions: we want that if \(f \in C(A)\) and \(f \in C(B)\), where \(A\) and \(B\) are union of intervals, then \(f \in C(A \cup B)\). With the usual definition of continuity in an interval, if \(f \in C([a, b]) \cap C([b, c])\) then we do not have \(f \in C([a, c])\). Of course, we have \(f \in C([a, c])\) if and only if \(f \in C([a, b^-]) \cap C([b^+, c])\), where, by definition, \(C([b^+, c]) = C([b, c])\) and \(C([a, b^-]) = C([a, b])\). This idea can be formalized with a suitable topological space.

Let us introduce some notation. We denote by \(\Omega^{(j)}\) the set of \(j\)-regular points or half-points, i.e., \(y \in \Omega^{(j)}\) if and only if \(y\) is \(j\)-regular, we say that \(y^+ \in \Omega^{(j)}\) if and only if \(y\) is right \(j\)-regular, and we say that \(y^- \in \Omega^{(j)}\) if and only if \(y\) is left \(j\)-regular. Obviously, \(\Omega^{(k)} = \emptyset\) and \(\Omega_{j+1} \cup \cdots \cup \Omega_{k} \subseteq \Omega^{(j)}\). Observe that \(\Omega^{(j)}\) depends on \(p\) (see Definition 6).

**Remark.** If \(0 \leq j < k\) and \(I\) is an interval, \(I \subseteq \Omega^{(j)}\), then the set \(I \setminus (\Omega_{j+1} \cup \cdots \cup \Omega_{k})\) is discrete (see the Remark before Definition 7 in [RARP1]).

**Definition 7.** We say that a function \(h\) belongs to the class \(AC_{loc}(\Omega^{(j)})\) if \(h \in AC_{loc}(I)\) for every connected component \(I\) of \(\Omega^{(j)}\).

**Definition 8.** We say that the vectorial measure \(\mu = (\mu_0, \ldots, \mu_k)\) is \(p\)-admissible if \((\mu_j)_s(\mathbb{R} \setminus \Omega^{(j)}) = 0\) for \(1 \leq j \leq k\).

We use the letter \(p\) in \(p\)-admissible in order to emphasize the dependence on \(p\) (recall that \(\Omega^{(j)}\) depends on \(p\)).

**Remarks.**
1. There is no condition on \(\text{supp}(\mu_0)_s\).
2. We have \((\mu_k)_s = 0\), since \(\Omega^{(k)} = \emptyset\).
3. Every absolutely continuous measure is \(p\)-admissible.

**Definition 9.** (Sobolev space.) Let us consider \(1 \leq p < \infty\) and \(\mu = (\mu_0, \ldots, \mu_k)\) a \(p\)-admissible vectorial measure. We define the Sobolev space \(W^{k,p}(\Delta, \mu)\) as the space of equivalence classes of

\[V^{k,p}(\Delta, \mu) := \left\{ f : \Delta \to \mathbb{C} \mid f^{(j)} \in AC_{loc}(\Omega^{(j)}) \text{ for } 0 \leq j < k \quad \text{and} \quad \|f^{(j)}\|_{L^p(\Delta, \mu_j)} < \infty \quad \text{for } 0 \leq j \leq k \right\},\]

with respect to the seminorm

\[\|f\|_{W^{k,p}(\Delta, \mu)} := \left( \sum_{j=0}^{k} \|f^{(j)}\|_{L^p(\Delta, \mu_j)}^p \right)^{1/p}.\]

**Remarks.** This definition is natural since when the \((\mu_j)_s\)-measure of the set where \(|f^{(j)}|\) is not continuous is positive, the integral \(\int |f^{(j)}|^p \, d(\mu_j)_s\) does not make sense. If we consider Sobolev spaces with real valued functions every result in this paper also holds.
At this moment we can consider also norms like the following:

\[
\|f\|_p = \int_{-1}^{1} |f(t)|^p + \int_{0}^{1} |x|^p |f(t)|^p + \int_{0}^{1} |f(t)|^p + |f(t_0)|^p,
\]

\[
\|f\|_p = \int_{0}^{1} |f(t)|^p + \int_{0}^{1} |f(t)|^p + |f(t_0)|^p.
\]

In the second example, we can write \(|f(t_0)|^p\) instead of \(|f(t_0^+)|^p\), since \(f\) is not defined at the left of 0, and then this causes no confusion. Obviously we always write \((a + b)\delta_{x_0}^+\) instead of \(a\delta_{x_0}^+ + b\delta_{x_0^-}\).

**Definition 10.** Let us consider \(1 \leq p < \infty\) and \(\mu\) a \(p\)-admissible vectorial measure. Let us define the space \(K(\Delta, \mu)\) as

\[
K(\Delta, \mu) := \{ g : \Omega(0) \rightarrow \mathbb{C} | g \in W^{k,p}(\Omega(0), \mu|_{\Omega(0)}), \|g\|_{W^{k,p}(\Omega(0), \mu|_{\Omega(0)})} = 0 \}.
\]

\(K(\Delta, \mu)\) is the equivalence class of 0 in \(W^{k,p}(\Omega(0), \mu|_{\Omega(0)})\). It plays an important role in the general theory of Sobolev spaces and in the study of the multiplication operator in Sobolev spaces in particular (see [RARP1], [RARP2], Theorem A below and Theorem C in Section 4).

**Definition 11.** Let us consider \(1 \leq p < \infty\) and \(\mu\) a \(p\)-admissible vectorial measure. We say that \((\Delta, \mu)\) belongs to the class \(\mathcal{C}_0\) if there exist compact sets \(M_n\), which are a finite union of compact intervals, such that

1. \(M_n\) intersects at most a finite number of connected components of \(\Omega_1 \cup \cdots \cup \Omega_k\),
2. \(K(M_n, \mu) = \{0\}\),
3. \(M_n \subseteq M_{n+1}\),
4. \(\cup_n M_n = \Omega(0)\).

We say that \((\Delta, \mu)\) belongs to the class \(\mathcal{C}\) if there exists a measure \(\mu'_0 = \mu_0 + \sum_{m \in D} c_m \delta_{x_m}\) with \(c_m > 0\), \(\{x_m\} \subset \Omega(0)\), \(D \subset \mathbb{N}\) and \((\Delta_0, \mu'_0) \in \mathcal{C}_0\), where \(\mu' = (\mu'_0, \mu_1, \ldots, \mu_k)\) is minimal in the following sense: there exists \(\{M_n\}\) corresponding to \((\Delta, \mu')\) in \(\mathcal{C}_0\) such that if \(\mu''_0 = \mu'_0 - c_m \delta_{x_m}\) with \(m_0 \in D\) and \(\mu'' = (\mu''_0, \mu_1, \ldots, \mu_k)\), then \(K(M_{n}, \mu'') \neq \{0\}\) if \(x_{m_0} \in M_{n}\).

**Remarks.**

1. The condition \((\Delta, \mu) \in \mathcal{C}\) is not very restrictive. In fact, the proof of Theorem A below (see [RARP1], Theorem 4.3) gives that if \(\Omega(0) \setminus (\Omega_1 \cup \cdots \cup \Omega_k)\) has only a finite number of points in each connected component of \(\Omega(0)\), then \((\overline{\Omega}, \mu) \in \mathcal{C}\). If furthermore \(K(\Delta, \mu) = \{0\}\), we have \((\Delta, \mu) \in \mathcal{C}_0\).

2. Since the restriction of a function of \(K(\Delta, \mu)\) to \(M_n\) is in \(K(M_n, \mu)\) for every \(n\), then \((\Delta, \mu) \in \mathcal{C}_0\) implies \(K(\Delta, \mu) = \{0\}\).

3. If \((\Delta, \mu) \in \mathcal{C}_0\), then \((\Delta, \mu) \in \mathcal{C}\) with \(\mu' = \mu\).

4. The proof of Theorem A below gives that if for every connected component \(\Lambda\) of \(\Omega_1 \cup \cdots \cup \Omega_k\) we have \(K(\Lambda, \mu) = \{0\}\), then \((\Delta, \mu) \in \mathcal{C}_0\). Condition \#supp\(\mu_0|_{\Omega(0)} \geq k\) implies \(K(\Delta, \mu) = \{0\}\).

The next results, proved in [RARP1], play a central role in the theory of Sobolev spaces with respect to measures (see the proofs in [RARP1, theorems 4.3 and 5.1]).

**Theorem A.** Let us suppose that \(1 \leq p < \infty\) and \(\mu = (\mu_0, \ldots, \mu_k)\) is a \(p\)-admissible vectorial measure. Let \(K_j\) be a finite union of compact intervals contained in \(\Omega^{(j)}\), for \(0 \leq j < k\) and \(\overline{\nu}\) a right (or left) completion of \(\mu\). Then:

1. \((\Delta, \mu) \in \mathcal{C}_0\) there exist positive constants \(c_1 = c_1(K_0, \ldots, K_{k-1})\) and \(c_2 = c_2(\overline{\nu}, K_0, \ldots, K_{k-1})\) such that

\[
c_1 \sum_{j=0}^{k-1} \|g^{(j)}\|_{L^\infty(K_j)} \leq \|g\|_{W^{k,p}(\Delta, \mu)}, \quad c_2 \|g\|_{W^{k,p}(\Delta, \overline{\nu})} \leq \|g\|_{W^{k,p}(\Delta, \mu)}, \quad \forall g \in V^{k,p}(\Delta, \mu).
\]
(b) If \((\Delta, \mu) \in \mathcal{C}\) there exist positive constants \(c_3 = c_3(K_0, \ldots, K_{k-1})\) and \(c_4 = c_4(\overline{\mu}, K_0, \ldots, K_{k-1})\) such that for every \(g \in V^{k,p}(\Delta, \mu)\), there exists \(g_0 \in V^{k,p}(\Delta, \mu)\), independent of \(K_0, \ldots, K_{k-1}, c_3, c_4\) and \(\overline{\mu}\), with
\[
\|g_0 - g\|_{W^{k,p}(\Delta, \mu)} = 0,
\]
\[
c_3 \sum_{j=0}^{k-1} \|g_0^{(j)}\|_{L^\infty(K_j)} \leq \|g\|_{W^{k,p}(\Delta, \mu)} = \|g\|_{W^{k,p}(\Delta, \mu)},
\]
\[
c_4 \|g_0\|_{W^{k,p}(\Delta, \mu)} \leq \|g\|_{W^{k,p}(\Delta, \mu)}.
\]
Furthermore, if \(g_0, f_0\) are these representatives of \(g, f\) respectively, we have for the same constants \(c_3, c_4\)
\[
c_3 \sum_{j=0}^{k-1} \|g_0^{(j)} - f_0^{(j)}\|_{L^\infty(K_j)} \leq \|g - f\|_{W^{k,p}(\Delta, \mu)},
\]
\[
c_4 \|g_0 - f_0\|_{W^{k,p}(\Delta, \mu)} \leq \|g - f\|_{W^{k,p}(\Delta, \mu)}.
\]

Remark. Theorem A is proved in [RARP1] with the additional hypothesis that \(\overline{\mu} := \overline{\pi} - \mu\) is absolutely continuous, since [RARP1] only uses absolutely continuous completions, but the same proof also works in the general case.

Theorem B. Let us consider \(1 \leq p < \infty\) and \(\mu = (\mu_0, \ldots, \mu_k)\) a \(p\)-admissible vectorial measure with \((\Delta, \mu) \in \mathcal{C}\). Then the Sobolev space \(W^{k,p}(\Delta, \mu)\) is complete.

3. Results on Sobolev spaces.

We start this section with a technical result which shows how to modify a measure in order to have \((\Delta, \mu) \in \mathcal{C}\). We use this proposition in the proof of Corollary 3.2 below.

Proposition 3.1. Let us consider \(1 \leq p < \infty\) and \(\mu = (\mu_0, \ldots, \mu_k)\) a \(p\)-admissible vectorial measure. Then there exists a measure \(\mu_0^* \geq \mu_0\) with \(\mu_0^* - \mu_0\) discrete and finite, \((\mu_0^* - \mu_0)(\mathbb{R} \setminus \Omega^{(0)}) = 0\), and such that \(\mu^* := (\mu_0^*, \mu_1, \ldots, \mu_k)\) is \(p\)-admissible and \((\Delta, \mu^*) \in \mathcal{C}_0\). We have also \(V^{k,p}(\Delta, \mu) \cap L^\infty(\Omega^{(0)}) \subseteq V^{k,p}(\Delta, \mu^*)\) and
\[
\|f\|_{W^{k,p}(\Delta, \mu^*)} \leq \|f\|_{W^{k,p}(\Delta, \mu)} + \|f\|_{L^\infty(\Omega^{(0)})},
\]
for every \(f \in V^{k,p}(\Delta, \mu)\).

Proof. Let us consider the connected components \(\{A_m\}_{m=1}^M (M \in \mathbb{N} \cup \{\infty\})\) of \(\Omega_1 \cup \cdots \cup \Omega_k\). For each \(m\), choose \(k\) points \(x^1_m, \ldots, x^k_m \in A_m\), and now define the measure
\[
\mu_0^* := \mu_0 + \frac{1}{k} \sum_{i=1}^k \sum_{m=1}^M 2^{-m} \delta_{x^i_m}.
\]
Obviously \(\mu_0^* - \mu_0\) is discrete and finite, and \((\mu_0^* - \mu_0)(\mathbb{R} \setminus \Omega^{(0)}) = 0\). Obviously \(\mu^*\) is \(p\)-admissible since \(\mu\) is \(p\)-admissible. We see now that \(K(\overline{A}_m, \mu^*) = \{0\}\).

Let us consider \(q \in K(\overline{A}_m, \mu^*)\). For each \(y \in A_m\), there is a \(1 \leq j \leq k\) with \(y \in \Omega_j\). Let \(I\) be the connected component of \(\Omega_j\) which contains the point \(y\). If \(w_j\) denotes the absolutely continuous part of \(\mu_j\), we have that
\[
\int_I |q^{(j)}(x)|^p w_j(x) dx = 0,
\]
which is directly a consequence of H"older’s inequality. Since \(q \in K(\overline{A}_m, \mu^*)\), Hölder’s inequality gives
\[
\|q^{(j)}\|_{L^1(I')} \leq \|q^{(j)}\|_{L^p(I', w_j)} \|w_j^{-\frac{1}{p-1}}\|_{L^{1/(p-1)}(I')} = 0,
\]
for every compact interval \(I' \subset I\), since \(w_j \in B_p(\Omega_j)\). Then \(q^{(j)} \equiv 0\) in \(I\) and \(q^{(j)} \equiv 0\) in \(I'\). We have that \(q' |_{P_{j-1}} \subseteq P_{k-1}\). Then we obtain \(q |_{A_m} \in P_{k-1}\), since \(A_m\) is connected. We conclude \(q = 0\) in \(A_m\) since \(q(x^1_m) = \cdots = q(x^k_m) = 0\). The same argument gives \(K(J, \mu) = \{0\}\) for every closed interval \(J \subset \overline{A}_m\) with \(x^1_m, \ldots, x^k_m \in J\).
For each $m$ and $n$, let us consider a compact interval $J_{n,m}$ with $x_{n}^{1}, \ldots, x_{n}^{p} \in J_{n,m}$, $J_{n,m} \subseteq J_{n+1,m}$ and $\cup_{n}J_{n,m} = A_{m} \cap \Omega(0)$. We define now $M_{n} := \cup_{m \in D_{n}}J_{n,m}$, where $D_{n} := \{ m : |A_{m}| \geq 1/n \text{ and } A_{m} \cap (-n, n) \neq \emptyset \}$. Since $\#D_{n} \leq 2n^{d} + 1$ and $K(J_{n,m}, \mu^{*}) = \{ 0 \}$, this choice of $\{ M_{n} \}$ gives $(\Delta, \mu^{*}) \in C_{0}$.

Assume now that $f \in V^{k,p}(\Delta, \mu) \cap L^{\infty}(\Omega(0))$. We have that

$$|f(x_{n}^{i})| \leq \|f\|_{L^{\infty}(\Omega(0))},$$

for every $m$ and $i$, since $f$ is continuous at $x_{n}^{i}$. We have also

$$\int |f|^{p}d\mu_{0}^{*} = \int |f|^{p}d\mu_{0} + \int |f|^{p}d(\mu_{0}^{*} - \mu_{0}) \leq \|f\|_{L^{p}(\mu_{0})}^{p} + \|f\|_{L^{\infty}(\Omega(0))}^{p},$$

$$\|f\|_{L^{p}(\mu_{0})} \leq \|f\|_{L^{p}(\mu_{0})} + \|f\|_{L^{\infty}(\Omega(0))},$$

$$\|f\|_{W^{k,p}(\Delta, \mu)} \leq \|f\|_{W^{k,p}(\Delta, \mu)} + \|f\|_{L^{\infty}(\Omega(0))},$$

since $(\mu_{0}^{*} - \mu_{0})(\mathbb{R}) = (\mu_{0}^{*} - \mu_{0})(\Omega(0)) \leq 1$. Then we have $V^{k,p}(\Delta, \mu) \cap L^{\infty}(\Omega(0)) \subseteq V^{k,p}(\Delta, \mu^{*})$. 

An immediate computation gives the following technical result.

**Lemma 3.1.** Let us consider $1 \leq p < \infty$ and $\mu := (\mu_{0}, \ldots, \mu_{k})$ a vectorial measure with

$$d\mu_{j+1}(x) \leq c_{1}^{j}|x - x_{0}|^{p}d\mu_{j}(x),$$

for $0 \leq j < k$, $x_{0} \in \mathbb{R}$ and $x$ in an interval $I$. Let $\varphi \in C^{k}(\mathbb{R})$ be such that $\text{supp} \varphi' \subseteq [\lambda_{1}, \lambda_{1} + \ell] \cup [\lambda_{2}, \lambda_{2} + \ell] \subseteq I$, with $\lambda_{1} + t < 2t$, $\max(\lambda_{1} - x_{0}, |\lambda_{1} + t - x_{0}, |\lambda_{2} - x_{0}, |\lambda_{2} + t - x_{0}) \leq c_{2}\ell$ and $\|\varphi(j)\|_{L^{\infty}(I)} \leq c_{3}\ell^{-j}$ for $0 \leq j \leq k$. Then, there is a positive constant $c_{0}$ which is independent of $I, x_{0}, \lambda_{1}, \lambda_{2}, t, \mu, \varphi$ and $g$ such that

$$\|\varphi g\|_{W^{k,p}(\Delta, \mu)} \leq c_{0}\|g\|_{W^{k,p}(\mu)},$$

for every $g \in C^{k}(\mathbb{R})$ with $\text{supp} (\varphi g) \subseteq I$.

**Remarks.**

1. The constant $c_{0}$ can depend on $c_{1}, c_{2}, c_{3}, p$ and $k$.

2. In the proof we only use the hypothesis $g \in C^{k}(\mathbb{R})$ to assure that $\int |g(j)|^{p}d\mu_{j}$ has sense (although it can be infinite). Therefore, if $\mu$ is $p$-admissible, the result is also true for every $g \in V^{k,p}(\Delta, \mu)$ with $\text{supp} (\varphi g) \subseteq I$.

3. Condition $d\mu_{j+1}(x) \leq c_{1}^{j}|x - x_{0}|^{p}d\mu_{j}(x)$ means that $\mu_{j+1}$ is absolutely continuous with respect to $\mu_{j}$, and that the Radon-Nikodym derivative satisfies $d\mu_{j+1}/d\mu_{j} \leq c_{1}^{j}|x - x_{0}|^{p}$. Proposition 3.2 below shows that this condition is not as restrictive as it seems, since many weights with analytic singularities can be modified in order to satisfy it.

We define now the following functions,

$$\log_{1} x := - \log x, \quad \log_{2} x := \log(\log_{1} x), \quad \ldots, \quad \log_{n} x := \log(\log_{n-1} x).$$

With this definition we have the following result, which is a consequence of Muckenhoupt inequality.

**Proposition 3.2.** Let us consider $1 \leq p < \infty$ and $w = (w_{0}, \ldots, w_{k})$ a finite vectorial weight in $(a, b)$. Assume also that there exist $0 \leq k_{0} < k$, $x_{0} \in \mathbb{R}$, a neighbourhood $U$ of $x_{0}$, $n \in \mathbb{N}$, $c_{i} > 0$, $\xi_{i} \geq 0$ and $\alpha_{i}$, $\gamma_{i}$, $\ldots, \gamma_{n} \in \mathbb{R}$ for $k_{0} \leq i \leq k$ such that

1. $w_{j}(x) \sim e^{-c_{i}|x - x_{0}|^{-\xi_{i}}}|x - x_{0}|^{\alpha_{i}} \log^{\gamma_{i}}|x - x_{0}| \cdots \log^{\gamma_{n}}|x - x_{0}|$ for $x \in U$ and $k_{0} \leq i \leq k$,

2. $(1 + \alpha_{i})p / n \notin \mathbb{N}$ if $\xi_{i} = 0$ and $k_{0} < i \leq k,$

3. $w_{k} \notin B_{p}(U)$.

Then there exists a weight $w^{*}$ in $(a, b)$ such that the Sobolev norms $W^{k,p}([a, b], w)$ and $W^{k,p}([a, b], w^{*})$ are comparable for every function in $W^{k,p}([a, b], w)$ and satisfying

$$w_{j+1}^{*}(x) \leq c_{i}|x - x_{0}|^{p}w_{j}^{*}(x),$$

for $k_{0} \leq j < k$ and $x \in U$, for some $k_{0} \leq k'_{0} < k$. Furthermore, if $k_{0} \neq k'_{0}$ then we have $w_{k_{0}}^{*} \in B_{p}(U)$.
The following result reveals a big problem when dealing with the completion of \( P \). Furthermore, it allows to prove Theorem 4.5 about the multiplication operator.

**Theorem 3.1.** Let us consider \( 1 \leq p < \infty \) and \( \mu = (\mu_0, \ldots, \mu_k) \) a finite vectorial measure with \( \Delta \) a compact set. Assume that there exist \( x_0 \in \mathbb{R} \) and \( 0 \leq k_0 \leq k \) with \( \mu_{k_0}(\{x_0\}) = 0 \) and satisfying the following property if \( k_0 < k \): there exist an open neighbourhood \( U \) of \( x_0 \) and \( c > 0 \) such that

\[
d\mu_{j+1}(x) \leq c|x - x_0|^p d\mu_j(x),
\]

for \( x \in U \) and \( k_0 \leq j < k \). Let us define

\[
\nu := (0, \ldots, 0, \alpha_{k_0} \delta_{x_0}, \alpha_{k_0+1} \delta_{x_0}, \ldots, \alpha_k \delta_{x_0})
\]

and \( N := \# \{ k_0 \leq j \leq k : \alpha_j > 0 \} \). Given a Cauchy sequence \( \{q_n\} \subset P \) in \( W^{k,p}(\Delta, \mu) \) and \( u_{k_0}, \ldots, u_k \in \mathbb{R} \) there exists a Cauchy sequence \( \{r_n\} \subset P \) in \( W^{k,p}(\Delta, \mu) \) with \( \lim_{n \to \infty} \|q_n - r_n\|_{W^{k,p}(\Delta, \mu)} = 0 \) and \( r^{(j)}_n(x_0) = u_j \) for \( k_0 \leq j \leq k \). Consequently \( P^{k,p}(\Delta, \mu + \nu) \) is isomorphic to \( P^{k,p}(\Delta, \mu) \times \mathbb{R}^N \).

**Remark.** Observe that \( P^{k,p}(\Delta, \mu + \nu) \) is not a space of functions even when \( P^{k,p}(\Delta, \mu) \) is a space of functions. In fact, if \( q \) is an element of \( P^{k,p}(\Delta, \mu) \), then it represents \( \mathbb{R}^N \) elements of \( P^{k,p}(\Delta, \mu + \nu) \), and therefore there are infinitely many equivalence classes in \( P^{k,p}(\Delta, \mu + \nu) \) whose restriction to \( P^{k,p}(\Delta, \mu) \) coincides with \( q \). Hence, the values \( f^{(j)}(x_0) \) for \( k_0 \leq j \leq k \) do not represent anything related with the derivatives of \( f \in P^{k,p}(\Delta, \mu + \nu) \).

**Proof.** It is enough to see that, given sequences \( \{v^n_{j_0}\}, \ldots, \{v^n_k\} \subset \mathbb{R} \), there exists a sequence \( \{s_n\} \subset P \) converging to \( 0 \) in the norm of \( W^{k,p}(\Delta, \mu) \) with \( s_n^{(j)}(x_0) = v^n_j \) for \( k_0 \leq j \leq k \), since then we can take

\[
r_n := q_n - s_n \text{ with } v^n_j := q_n^{(j)}(x_0) - u_j.
\]

Let us consider the polynomial \( h_n \in P_{k-k_0} \) with \( h_n^{(j-k_0)}(x_0) = v^n_j \) for \( k_0 \leq j \leq k \), a function \( \varphi \in C^\infty_c(\mathbb{R}) \) with \( 0 \leq \varphi \leq 1 \) and

\[
\varphi(x) := \begin{cases} 
1, & \text{if } x \in [-1,1], \\
0, & \text{if } x \notin [-2,2],
\end{cases}
\]

and the functions

\[
\varphi_t(x) := \varphi \left( \frac{x - x_0}{t} \right),
\]

for each \( 0 < t \leq t_0 \), where \( t_0 \) is any positive number with \( \text{supp } \varphi_t \subset U \). For each \( n \in \mathbb{N} \), define the function

\[
g_n := h_n \varphi_t, \text{ where } \{t_n\} \text{ is a sequence converging to } 0, \text{ with } 0 < t_n < t_0, \text{ which will be chosen later.}
\]

Let us define \( f_n := g_n \) if \( k_0 = 0 \) and

\[
f_n(x) := \int_{x_0 + 2t_n}^x g_n(t) \frac{(x - t)^{k_0 - 1}}{(k_0 - 1)!} \, dt,
\]

otherwise. Since we have

\[
f_n^{(j)}(x) = \int_{x_0 + 2t_n}^x g_n(t) \frac{(x - t)^{k_0 - j - 1}}{(k_0 - j - 1)!} \, dt,
\]

for \( 0 \leq j < k_0 \), \( \mu \) is finite and \( \Delta \) is compact, we obtain that

\[
\|f_n^{(j)}\|_{L^p(\mu_t)} \leq c \|f_n^{(j)}\|_{L^\infty(\Delta)} \leq c \|g_n\|_{L^1(\mathbb{R})} \leq c \|h_n\|_{L^1([x_0 - 2t_n, x_0 + 2t_n])},
\]

for \( 0 \leq j < k_0 \). If \( k_0 < k \), Lemma 3.1 gives that

\[
\sum_{j=k_0}^k \|f_n^{(j)}\|_{L^p(\mu_t)} = \sum_{j=k_0}^k \|g_n^{(j-k_0)}\|_{L^p(\mu_t)}
\]

\[
\leq c \|h_n\varphi_{t_n}^\ast\|_{W^{k-k_0,p}(\{x_0 - 2t_n, x_0 + 2t_n\}, (\mu_{k_0}, \ldots, \mu_k))}.
\]

13
We can apply Lemma 3.1 since

\[ \supp \varphi'_{t_n} \subseteq [x_0 - 2t_n, x_0 - t_n] \cup [x_0 + t_n, x_0 + 2t_n] \subseteq [x_0 - 2t_n, x_0 + 2t_n], \]

\[ \max \{ |2t_n|, |t_n|, t_n, 2t_n \} = 2t_n, \]

\[ \| \varphi^{(j)} \|_{L^\infty(\mathbf{R})} = t_n^{-j} \| \varphi^{(j)} \|_{L^\infty(\mathbf{R})} \leq c t_n^{-j} \quad \text{for} \quad 0 \leq j \leq k - k_0, \]

\[ \supp g_n = \supp (h_n \varphi_{t_n}) \subseteq [x_0 - 2t_n, x_0 + 2t_n]. \]

If \( k_0 = k \), inequality (3.2) is also true since

\[ \| f_n^{(k)} \|_{L^p(\Delta, \mu_k)} = \| g_n \|_{L^p(\Delta, \mu_k)} \leq \| h_n \|_{L^p([x_0-2t_n, x_0+2t_n], \mu_k)} . \]

Inequalities (3.1) and (3.2) and the fact \( \mu_k(\{x_0\}) = \cdots = \mu_k(\{x_0\}) = 0 \) allow us to choose \( t_n \) small enough in order that

\[ (3.3) \]

\[ \| f_n \|_{W^{k,p}(\Delta, \mu)} < \frac{1}{n} . \]

If \( \Delta^* \) is the convex hull of \( \Delta \cup \{x_0\} \), we can choose \( p_n \in P \) such that

\[ (3.4) \]

\[ \| f_n^{(j)} - p_n^{(j)} \|_{L^\infty(\Delta^*)} < \frac{1}{n}, \]

for \( 0 \leq j \leq k \), since \( f_n \in C^\infty(\mathbf{R}) \). This is deduced from the compactness of \( \Delta \) and Bernstein’s proof of the Weierstrass Theorem, where the Bernstein polynomials approximate any function in \( C^k([a, b]) \) uniformly up to the \( k \)-th derivative (see e.g. [D, p.113]).

In particular, we have that

\[ f_n^{(j)}(x_0) = p_n^{(j)}(x_0) + \varepsilon_n^{(j)}(x_0), \]

for \( 0 \leq j \leq k \), then there exists a positive constant \( c \), which only depends on \( \Delta^* \), with

\[ (3.5) \]

\[ \| \varepsilon_n^{(j)} \|_{L^\infty(\Delta^*)} < \frac{c}{n} , \]

for \( 0 \leq j \leq k \). Therefore, the polynomial \( s_n := p_n + \varepsilon_n \) satisfies

\[ s_n^{(j)}(x_0) = p_n^{(j)}(x_0) + \varepsilon_n^{(j)}(x_0) = f_n^{(j)}(x_0) = g_n^{(j-k_0)}(x_0) = h_n^{(j-k_0)}(x_0) = v_n^j, \]

for \( k_0 \leq j \leq k \), and (3.3), (3.4) and (3.5) show that there is a positive constant \( c \), which does not depend on \( n \), with

\[ \| s_n \|_{W^{k,p}(\Delta, \mu)} < \frac{c}{n} . \]

This finishes the proof of Theorem 3.1.

The proof of Theorem 3.1 gives the following result.

**Corollary 3.1.** Let us consider \( 1 \leq p < \infty \) and \( \mu = (\mu_0, \ldots, \mu_k) \) a finite vectorial measure with \( \Delta \) a compact set. Assume that there exist \( x_0 \in \mathbf{R} \) and \( 0 \leq k_0 \leq k \) with \( \mu_{k_0}(\{x_0\}) = 0 \) and satisfying the following property if \( k_0 < k \): there exist an open neighbourhood \( U \) of \( x_0 \) and \( c > 0 \) such that

\[ d\mu_{j+1}(x) \leq c|x - x_0|^p \, d\mu_j(x) , \]

for \( x \in U \) and \( k_0 \leq j < k \). Given sequences \( \{v_n^0, \ldots, v_n^k\} \subset \mathbf{R} \) there exists a sequence \( \{s_n\} \subset P \) converging to 0 in the norm of \( W^{k,p}(\Delta, \mu) \) with \( s_n^{(j)}(x_0) = v_n^j \) for \( k_0 \leq j \leq k \).
We have also the following consequences of Theorem 3.1.

**Corollary 3.2.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \mathbb{R}$, $0 \leq k_0 < k$, an open neighbourhood $U$ of $x_0$ and $c > 0$ such that

$$d_{\mu_{j+1}}(x) \leq c |x - x_0|^p d_{\mu_j}(x),$$

for $x \in U$ and $k_0 \leq j < k$. Then $x_0$ is neither right nor left $k_0$-regular.

**Proof.** Without loss of generality we can assume that $\mu$ is absolutely continuous, since the $j$-regularity just depends on the absolutely continuous part of the measure. Consequently $\mu$ is $p$-admissible. Assume that $x_0$ is right or left $k_0$-regular and consider the measure $\mu^*$ as in Proposition 3.1 with the additional condition $x_m \neq x_0$ for every $m$ and $i$. Then $(\Delta, \mu^*) \in C_0$ and we have by Theorem A

$$|g^{(k_0)}(x_0)| \leq c \|g\|_{W^{k,p}(\Delta, \mu^*)}, \quad \forall g \in V^{k,p}(\Delta, \mu),$$

and consequently

$$|q^{(k_0)}(x_0)| \leq c \|q\|_{W^{k,p}(\Delta, \mu^*)}, \quad \forall q \in P,$$

since $\mu^*$ finite and $\Delta$ compact imply $\mu^* \in M$. The measure $\mu^*$ satisfies the hypotheses in Theorem 3.1 and therefore there exists a sequence of polynomials $\{r_n\}$ with $r_n^{(k_0)}(x_0) = 1$ and $\lim_{n \to \infty} \|r_n\|_{W^{k,p}(\Delta, \mu^*)} = 0$, which contradicts the last inequality.

**Corollary 3.3.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \mathbb{R}$ and $0 \leq k_0 \leq k$ with $\mu_{k_0}(\{x_0\}) = 0$ and satisfying the following property if $k_0 < k$: there exists an open neighbourhood $U$ of $x_0$ such that $\mu_j(U) = 0$ for $k_0 < j < k$. Let us define

$$\nu := (0, \ldots, 0, \alpha_{k_0} \delta_{x_0}, \alpha_{k_0+1} \delta_{x_0}, \ldots, \alpha_k \delta_{x_0})$$

and $N := \#\{k_0 \leq j \leq k : \alpha_j > 0\}$. Given a Cauchy sequence $\{q_n\} \subset P$ in $W^{k,p}(\Delta, \mu)$ and $u_{k_0}, \ldots, u_k \in \mathbb{R}$ there exists a Cauchy sequence $\{r_n\} \subset P$ in $W^{k,p}(\Delta, \mu)$ with $\lim_{n \to \infty} \|q_n - r_n\|_{W^{k,p}(\Delta, \mu)} = 0$ and $r_j(x_0) = u_j$ for $k_0 \leq j \leq k$. Consequently $P^{k,p}(\Delta, \mu + \nu)$ is isomorphic to $P^{k,p}(\Delta, \mu) \times \mathbb{R}^N$.

The following result (which will be used in the proof of Theorem 3.3) is an improvement of Theorem 3.1 in [RARP2]. The same arguments used in the proof of Theorem 3.1 in [RARP2] give this result.

**Theorem 3.2.** Let us consider $1 \leq p < \infty$, $\mu = (\mu_0, \ldots, \mu_k)$ a vectorial measure and a closed set $I \subseteq \Delta$ with $\mu|_I$ $p$-admissible and $(I, \mu) \in C_0$. Assume that $K \subseteq I$ is a finite union of compact intervals $J_1, \ldots, J_n$ and that for every $J_m$ there is an integer $0 \leq k_m \leq k$ satisfying $J_m \subseteq \Omega^{(k_m - 1)}$, if $k_m > 0$, and $\mu_j(J_m) = 0$ for $k_m < j \leq k$, if $k_m < k$. If $\mu_j(K) \leq 0$ for $0 < j \leq k$, then there exists a positive constant $c_0$ such that

$$c_0 \|fg\|_{W^{k,p}(\Delta, \mu)} \leq \|f\|_{W^{k,p}(I, \mu)} \left(\sup_{x \in I} |g(x)| + \|g\|_{W^{k,p}(I, \mu)}\right),$$

for every $f, g \in V^{k,p}(I, \mu)$ and defined on $\Delta$ with supp $(fg) \subseteq I$ and $g' = g'' = \cdots = g^{(k)} = 0$ in $I \setminus K$.

**Remark.** The sets $\Omega^{(j)}$ are constructed with respect to $(I, \mu)$.

Theorem 3.2 gives the following result corresponding to the case $n = 1$ and $k_1 = k$.

**Corollary 3.4.** Let us consider $1 \leq p < \infty$, $\mu = (\mu_0, \ldots, \mu_k)$ a vectorial measure and a closed set $I \subseteq \Delta$ with $\mu|_I$ $p$-admissible and $(I, \mu) \in C_0$. Assume that $K$ is a compact interval contained in $I \cap \Omega^{(k-1)}$. If $\mu_j(K) \leq 0$ for $0 < j \leq k$, then there exists a positive constant $c_0$ such that

$$c_0 \|fg\|_{W^{k,p}(\Delta, \mu)} \leq \|f\|_{W^{k,p}(I, \mu)} \left(\sup_{x \in I} |g(x)| + \|g\|_{W^{k,p}(I, \mu)}\right),$$

for every $f, g \in V^{k,p}(I, \mu)$ and defined on $\Delta$ with supp $(fg) \subseteq I$ and $g' = g'' = \cdots = g^{(k)} = 0$ in $I \setminus K$. 15
We need some technical result.

**Lemma 3.2.** Let us consider $1 < p < \infty$, $c_1, c_2 > 0$ and $w$ a (one-dimensional) weight.

1. If $w$ satisfies
   \[ \|w\|_{L^1([\alpha, \beta])} < c_1 \quad \text{and} \quad c_2 < \|w^{-1}\|_{L^{1/(p-1)}([\alpha, \beta])}, \]
   then there exists a weight $v \geq w$ such that
   \[ \|v\|_{L^1([\alpha, \beta])} < c_1 \quad \text{and} \quad c_2 < \|v^{-1}\|_{L^{1/(p-1)}([\alpha, \beta])} < \infty. \]

2. If $w \in L^1([a, b])$ and satisfies
   \[ \|w^{-1}\|_{L^{1/(p-1)}([a, a+\epsilon])} = \infty, \quad \text{for every } \epsilon > 0, \]
   then there exists a weight $v \geq w$ such that $v \in L^1([a, b])$,
   \[ \|v^{-1}\|_{L^{1/(p-1)}([a+\epsilon, b])} < \infty, \quad \text{for every } \epsilon > 0, \quad \text{and} \quad \|v^{-1}\|_{L^{1/(p-1)}([a, b])} = \infty. \]

**Proof.** We first prove (1). For each $t > 0$, let us consider the function $w_t := \max(t, w)$, which obviously satisfies $w_t \geq w$. Recall that if $\mu$ is a $\sigma$-finite measure in $X$, every measurable function $g \geq 0$ satisfies
   \[ \int_X g \, d\mu = \int_0^\infty \mu(\{x \in X : g(x) \geq \lambda\}) \, d\lambda. \]

Therefore we have that
   \[ a(t) := \|w_t\|_{L^1([\alpha, \beta])} = \int_0^\infty \mu(\{x \in [\alpha, \beta] : \max(t, w(x)) \geq \lambda\}) \, d\lambda \]
   \[ = \int_t^\infty \mu(\{x \in [\alpha, \beta] : w(x) \geq \lambda\}) \, d\lambda + (\beta - \alpha) \cdot t, \]
   \[ b_p(t)^{1/(p-1)} := \int_0^\beta w_t^{-1/(p-1)} = \int_0^\infty \mu(\{x \in [\alpha, \beta] : \min(t^{-1/(p-1)}, w(x)^{-1/(p-1)}) \geq \lambda\}) \, d\lambda \]
   \[ = \int_0^t \mu(\{x \in [\alpha, \beta] : w(x)^{-1/(p-1)} \geq \lambda\}) \, d\lambda \leq t^{-1/(p-1)}(\beta - \alpha) < \infty. \]

Since $a(t)$ and $b_p(t)$ are continuous functions for $t > 0$ and
   \[ \lim_{t \to 0^+} a(t) = \|w\|_{L^1([\alpha, \beta])}, \quad \lim_{t \to 0^+} b_p(t) = \|w^{-1}\|_{L^{1/(p-1)}([\alpha, \beta])}, \]
we can take $v := w_t$ for small enough $t > 0$.

In order to prove (2), let us choose $x_0 := b$ and $x_{n+1} \in (a, \min\{a + 2^{-n}, x_n\})$ such that
   \[ \|w^{-1}\|_{L^{1/(p-1)}([x_{n+1}, x_n])} > 1. \]

By part (1) we can take a weight $v_n \geq w$ in $[x_{n+1}, x_n]$ with
   \[ 1 < \|v_n^{-1}\|_{L^{1/(p-1)}([x_{n+1}, x_n])} < \infty, \quad \text{and} \quad \|v_n\|_{L^1([x_{n+1}, x_n])} \leq \|w\|_{L^1([x_{n+1}, x_n])} + x_n - x_{n+1}. \]

If we define $v$ in $(a, b)$ by $v := v_n$ in $(x_{n+1}, x_n]$, we have $v \geq w$,
   \[ \|v^{-1}\|_{L^{1/(p-1)}([a, b])} = \infty, \quad \|v^{-1}\|_{L^{1/(p-1)}([x_n, b])} < \infty, \quad \|v^{-1}\|_{L^{1/(p-1)}([x_n, b])} \leq \|w\|_{L^1([a, b])} + b - a, \]
and this finishes the proof. \(\square\)
Theorem A gives that if $\mu$ is $p$-admissible, $(\Delta, \mu) \in C_0$ and $x_0$ is $(k - 1)$-regular, then we have
\[
c_1 |f^{(k-1)}(x_0)| \leq \|f\|_{W^{k,p}(\Delta, \mu)},
\]
for every $f \in W^{k,p}(\Delta, \mu)$. The following result, which will be used to prove Theorem 4.4, says that this inequality is always false if $x_0$ is not $(k - 1)$-regular.

**Theorem 3.3.** Let us consider $1 < p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a vectorial measure such that there exist $\eta_0 > 0$, $x_0 \in \mathbb{R}$ and $0 < k_0 \leq k$ with $\mu_j([x_0 - \eta_0, x_0 + \eta_0]) < \infty$ for $0 \leq j \leq k_0$ and $\mu_j([x_0 - \eta_0, x_0 + \eta_0]) = 0$ for $k_0 < j \leq k$ (if $k_0 < k$). Let us assume that $x_0$ is neither right nor left $(k - 1)$-regular and that $\mu_{k_0 - 1} \{x_0\} = 0$. Then, for any $0 < \eta \leq \eta_0$, there is no positive constant $c_1$ with
\[
c_1 |f^{(k_0-1)}(x_0)| \leq \|f\|_{W^{k,p}(\Delta, \mu)},
\]
for every $f \in C^\infty_c([x_0 - \eta, x_0 + \eta])$.

If we have also that $\mu$ is finite and $\Delta$ is a compact set, then there is no positive constant $c_2$ with
\[
c_2 |q^{(k_0-1)}(x_0)| \leq \|q\|_{W^{k,p}(\Delta, \mu)},
\]
for every $q \in P$.

**Remark.** If $E$ is a closed set, we denote by $C^\infty_c(E)$ the set of functions $f \in C^\infty_c(\mathbb{R})$ with $\text{supp } f \subseteq E$.

**Proof.** In order to prove the first part of the theorem, without loss of generality we can assume that $k_0 = k$, since otherwise we can change $\Delta$ to $\Delta \cap [x_0 - \eta_0, x_0 + \eta_0]$. Let us denote by $w$ the absolutely continuous part of $\mu$. Observe that the fact that $x_0$ is neither right nor left $(k - 1)$-regular is equivalent to
\[
w_k \notin B_p([x_0, x_0 + \eta]) \cup B_p([x_0 - \eta, x_0]), \quad \text{for every } \eta > 0.
\]
We can assume that $w_j(x) \geq 1$ for $0 \leq j < k$ if $x \in [x_0 - \eta_0, x_0 + \eta_0]$ and $w_k(x) \in B_p([x_0 - \eta, x_0 + \eta] \setminus \{x_0\})$, since otherwise we can change $w_j(x)$ to $\max\{w_j(x), 1\}$ and $w_k(x)$ according to Lemma 3.2 in $[x_0 - \eta_0, x_0 + \eta_0]$. This increases the right hand side of the first inequality and does not change the fact that $w_k \notin B_p([x_0, x_0 + \eta]) \cup B_p([x_0 - \eta, x_0])$ for every $\eta > 0$.

Observe that it is enough to prove the first part of Theorem 3.3 for almost every $\eta \in (0, \eta_0]$ (with respect to Lebesgue measure). Let us fix $0 < \eta \leq \eta_0$ with $\mu_k([x_0 - \eta]) = \mu_k([x_0 + \eta]) = 0$ (the set of $\eta$’s in $(0, \eta_0]$ which do not satisfy this is at most denumerable since $\mu_k([x_0 - \eta_0, x_0 + \eta_0]) < \infty$).

Since $w_k \in B_p((x_0, x_0 + \eta]) \setminus B_p([x_0, x_0 + \eta])$, the function
\[
U(t) := \int_{x_0+t}^{x_0+\eta} w_k^{-1/(p-1)}
\]
is positive and continuous on $(0, \eta)$ and $\lim_{t \to 0^+} U(t) = \infty$; since for any sequence $\{y_n\}$ with $y_n \searrow 0$ as $n \to \infty$
\[
\lim_{n \to \infty} \int_{x_0-y_n}^{x_0-y_n} w_k^{-1/(p-1)} = \infty,
\]
for $n$ large enough there exists a point $x_n \in (0, \eta)$ such that
\[
(3.6) \quad \int_{x_0+x_n}^{x_0+\eta} w_k^{-1/(p-1)} = \int_{x_0-\eta}^{x_0-y_n} w_k^{-1/(p-1)}.
\]
We have also $x_n \searrow 0$ as $n \to \infty$. Therefore, we can choose decreasing sequences $\{y_n\}$ and $\{x_n\}$ satisfying
(3.6) and $\mu_k(\{x_0 - y_n\}) = \mu_k(\{x_0 + x_n\}) = 0$ for every $n$.  

17
Let us define $S := \text{supp}(\mu_k)$, and

$$h_n := w_k^{-1/(p-1)}\left(\chi_{[x_0-\eta, x_0] \setminus S} - \chi_{[x_0+x_n, x_0+\eta] \setminus S}\right).$$

Observe that $h_n \in L^1(\mathbb{R})$, since $w_k \in B_p([x_0-\eta_0, x_0 + \eta_0] \setminus \{x_0\})$.

If we define

$$g_n(x) := \int_{x_0+\eta}^x h_n(t) \frac{(x-t)^{k-1}}{(k-1)!} \, dt,$$

then $g_n^{(k-1)} = \int_{x_0+\eta}^x h_n \in AC_{loc}(\mathbb{R})$. We have also

$$g_n(x) = \int_{x_0+\eta}^x g_n^{(k-1)}(t) \frac{(x-t)^{k-2}}{(k-2)!} \, dt,$$

$$g_n^{(j)}(x) = \int_{x_0+\eta}^x g_n^{(k-1)}(t) \frac{(x-t)^{k-j-2}}{(k-j-2)!} \, dt,$$

for $0 \leq j \leq k-2$. Therefore there exists a positive constant $c$ such that

$$(3.7) \quad \|g_n^{(j)}\|_{L^p([x_0-\eta, x_0+\eta], \mu_k)} = \left( \int_{x_0-\eta}^{x_0+\eta} \int_{x_0+\eta}^x g_n^{(k-1)}(t) \frac{(x-t)^{k-j-2}}{(k-j-2)!} \, dt \right)^{1/p} \leq c \|g_n^{(k-1)}\|_{L^1([x_0-\eta, x_0+\eta])},$$

for $0 \leq j \leq k-2$, with $\mu_j([x_0-\eta, x_0+\eta]) < \infty$ for $0 \leq j \leq k$.

Since $\mu_k([x_0-\eta, x_0+\eta]) = \mu_k([x_0+\eta, x_0]) = \mu_k([x_0-x_0+\eta]) = 0$ and $\mu_k([x_0-x, x_0+\eta]) < \infty$, given any $\varepsilon > 0$ we can choose a function $I_n \in C_c((x_0-\eta, x_0-x_0+\eta) \cup (x_0+x_n, x_0+\eta))$ such that

$$\|I_n - h_n\|_{L^p([x_0-\eta, x_0+\eta], \mu_k)} \leq \varepsilon \quad \text{and} \quad \|I_n - h_n\|_{L^1([x_0-\eta, x_0+\eta])} \leq \varepsilon,$$

by Lemma 3.1 in [R] (recall that $h_n \in L^p([x_0-\eta, x_0+\eta], \mu_k) \cap L^1([x_0-\eta, x_0+\eta])$ and $h_n = 0$ on $(x_0-x_0, x_0+x_n)$). (This Lemma is just a version of the classical approximation result.) Since $\mu_k([x_0, x_0+\eta]) < \infty$ and $I_n \in C_c((x_0-\eta, x_0-x_0) \cup (x_0+x_n, x_0+\eta))$, by a convolution of $I_n$ with an approximation of identity, we can find a function $H_n \in C_c([x_0-x, x_0+\eta] \cup (x_0+x_n, x_0+\eta))$ such that

$$\|I_n - H_n\|_{L^p([x_0-\eta, x_0+\eta], \mu_k)} \leq \varepsilon \quad \text{and} \quad \|I_n - H_n\|_{L^1([x_0-\eta, x_0+\eta])} \leq \varepsilon.$$

Then we have

$$(3.8) \quad \|H_n - h_n\|_{L^p([x_0-\eta, x_0+\eta], \mu_k)} \leq 2\varepsilon \quad \text{and} \quad \|H_n - h_n\|_{L^1([x_0-\eta, x_0+\eta])} \leq 2\varepsilon.$$

We now define

$$G_n(x) := \int_{x_0+\eta}^x H_n(t) \frac{(x-t)^{k-1}}{(k-1)!} \, dt.$$

Let us fix a function $\varphi \in C_c(\mathbb{R})$ satisfying $0 \leq \varphi \leq 1$ in $\mathbb{R}$, $\varphi = 1$ in $[x_0-\eta/2, \infty)$ and $\varphi = 0$ in $(-\infty, x_0-\eta]$, and define $F_n := G_n \varphi$.

Assume that there is a positive constant $c_1$ with

$$c_1 \|f^{(k-1)}(x_0)\| \leq \|f\|_{W^{k,p}(\Delta, \mu)},$$

for every $f \in C_c^{\infty}([x_0-\eta, x_0+\eta])$. By Remark 1 after Definition 11 we have $([x_0-\eta, x_0+\eta], \mu) \in C_0$, since $w_k \in B_p([x_0-\eta, x_0+\eta] \setminus \{x_0\})$ and $w_j(x) \geq 1$ for $0 \leq j < k$, if $x \in [x_0-\eta, x_0+\eta]$, and this implies that $\Omega^{(0)} \setminus \Omega \cup \cdots \cup \Omega_k$ has at most three points $([x_0-\eta, x_0, x_0+\eta])$ and $K([x_0-\eta, x_0+\eta], \mu) = \{0\}$. By Corollary 3.4, with $K := [x_0-\eta, x_0-2\eta/2]$, we have

$$c_1 \|G_n^{(k-1)}(x_0)\| = c_1 \|F_n^{(k-1)}(x_0)\| \leq \|F_n\|_{W^{k,p}(\Delta, \mu)} \leq c \|G_n\|_{W^{k,p}(\Omega_{x_0-\eta, x_0+\eta}, \mu)},$$

and consequently

$$(3.9) \quad |G_n^{(k-1)}(x_0)| \leq c \|G_n\|_{W^{k,p}(\Omega_{x_0-\eta, x_0+\eta}, \mu)},$$

for every $n$. In order to apply Corollary 3.4 $\mu$ must be $p$-admissible; otherwise, applying Corollary 3.4, we can obtain (3.9) for $\mu_{ad}$ instead of $\mu$ (see Definition 15 in Section 4), and we have $\mu_{ad} \leq \mu$. 18
By (3.8), we have that there exists a positive constant \( c \), independent of \( n \) and \( \varepsilon \), such that
\[
\|g_n^{(j)} - G_n^{(j)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu)} \leq \left( \int_{x_0 - \eta}^{x_0 + \eta} \left( \int_x^{x_0 + \eta} |h_n(t) - H_n(t)| \left| \frac{x - t}{(k-j-1)!} \right| \, dt \right)^p \, d\mu_j(x) \right)^{1/p} \leq c \|h_n - H_n\|_{L^1([x_0 - \eta, x_0 + \eta])} \leq 2 \varepsilon,
\]
for \( 0 \leq j < k \), since \( \mu_j([x_0 - \eta, x_0 + \eta]) \) is finite. Recall that \( \|h_n - H_n\|_{L^1([x_0 - \eta, x_0 + \eta])} \leq 2 \varepsilon \), and therefore, we have that \( \|h_n - H_n\|_{L^1([x_0 - \eta, x_0 + \eta])} \leq 2 \varepsilon \).

Therefore, by (3.9) and (3.10), we obtain for some positive constant \( c \)
\[
|g_n^{(k-1)}(x_0) - 2 \varepsilon | \leq |g_n^{(k-1)}(x_0)| \leq c \|G_n\|_{W^{k,p}([x_0 - \eta, x_0 + \eta], \mu)} \leq c \left( \|g_n\|_{W^{k,p}([x_0 - \eta, x_0 + \eta], \mu)} + 2 \varepsilon \right),
\]
for every \( n \) and \( \varepsilon > 0 \). Consequently
\[
|g_n^{(k-1)}(x_0)| \leq c \|g_n\|_{W^{k,p}([x_0 - \eta, x_0 + \eta], \mu)},
\]
for every \( n \). Therefore by (3.7) we have that there exists a positive constant \( c \) such that
\[
c |g_n^{(k-1)}(x_0)| \leq \|g_n^{(k-1)}\|_{L^1([x_0 - \eta, x_0 + \eta])} \leq \|g_n^{(k-1)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_{k-1})} + \|g_n^{(k)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)} + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)},
\]
for every \( n \). Since \( w_{k-1} \geq 1 \) in \([x_0 - \eta, x_0 + \eta]\), there exists a positive constant \( c \) such that
\[
c |g_n^{(k-1)}(x_0)| \leq \|g_n^{(k-1)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_{k-1})} + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)} \leq \|g_n^{(k-1)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_{k-1})} + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], w_{k})},
\]
for every \( n \), since \( g_n^{(k)} = h_n = 0 \) in \( S = \text{supp}(\mu_k) \).

For every \( \varepsilon > 0 \) there exists \( \delta > 0 \) with \( \mu_{k-1}([x_0 - \delta, x_0 + \delta]) = \varepsilon \), since \( \mu_{k-1}([x_0 - \eta, x_0 + \eta]) \) is finite. Recall that \( g_n^{(k-1)} \in AC([x_0 - \eta, x_0 + \eta]) \). Therefore, we have that
\[
|g_n^{(k-1)}(x_0)| \leq |g_n^{(k-1)}(x_0) - g_n^{(k-1)}(x_0)| + |g_n^{(k-1)}(x_0)| + |g_n^{(k)}(x_0)| + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], w_k)} = \|g_n^{(k-1)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_{k-1})} + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)} + \|g_n^{(k-1)}(x_0)| + \|g_n^{(k)}(x_0)| + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)},
\]
which implies that
\[
|g_n^{(k-1)}(x_0)| \leq \|g_n^{(k-1)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_{k-1})} + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)} + \|g_n^{(k-1)}(x_0)| + \|g_n^{(k)}(x_0)| + \|h_n\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_k)},
\]
for every \( n \), since \( g_n^{(k)} = h_n = 0 \) in \( S = \text{supp}(\mu_k) \).

Claim. We have that \( |g_n^{(k-1)}(x)| \leq \|g_n^{(k-1)}\|_{L^p([x_0 - \eta, x_0 + \eta], \mu_{k-1})} \) is bounded.

If we have the claim, then as \( n \to \infty \) in (3.11), we obtain that \( c \leq 2^{1/p} \) (recall that \( g_n^{(k-1)}(x_0) \geq 0 \)), and since \( c > 0 \) is arbitrary we conclude that \( c = 0 \), which is a contradiction. This finishes the proof of the first part of Theorem 3.3, except for the claim.
We now prove the claim. We have for \( x \in [x_0 + \delta, x_0 + \eta] \)
\[
0 \leq g_n^{(k-1)}(x) \leq \int_{x_0 + \delta}^{x_0 + \eta} w_k^{1/(p-1) - 1} w_k^{-1/(p-1)}.
\]
The fact (3.6) gives \( g_n^{(k-1)}(x - \eta) = 0 \), and therefore \( g_n^{(k-1)}(x) = \int_{x_0 - \eta}^{x} h_n \). Then we have for \( x \in [x_0 - \eta, x_0 - \delta] \)
\[
0 \leq g_n^{(k-1)}(x) \leq \int_{x_0 - \delta}^{x_0 - \eta} w_k^{1/(p-1) - 1} w_k^{-1/(p-1)}.
\]
This finishes the proof of the claim.

If we have also that \( \mu \) is finite and \( \Delta \) is a compact set, then we obtain the result for polynomials, since we can approximate the \( k \)-th derivative of each function in \( C^k(\mathbb{R}) \) uniformly in \( \Delta \) by polynomials.

Theorem 3.3 and A give the following result.

**Corollary 3.5.** Let us consider \( 1 < p < \infty \) and \( \mu = (\mu_0, \ldots, \mu_k) \) a \( p \)-admissible vectorial measure with \( (\Delta, \mu) \in C_0 \) and such that there exist \( \eta_0 > 0 \), \( x_0 \in \mathbb{R} \) and \( 0 < k_0 \leq k \) with \( \mu_j([x_0 - \eta_0, x_0 + \eta_0]) < \infty \) for \( 0 \leq j < k_0 \) and \( \mu_j([x_0 - \eta_0, x_0 + \eta_0]) = 0 \) for \( k_0 < j \leq k \) (if \( k_0 < k \)). Then, there is a positive constant \( c_1 \) with

\[
c_1 |f^{(k_0-1)}(x)| \leq \|f\|_{W^{k,p}(\Delta, \mu)},
\]
for every \( f \in C^\infty([x_0 - \eta_0, x_0 + \eta_0]) \) if and only if \( x_0 \) is right or left \((k_0 - 1)\)-regular.

4. **Proof of the results for \( M \).**

First of all, some remarks about the definition of the multiplication operator.

**Definition 12.** We say that the multiplication operator is well defined in \( P^{k,p}(\Delta, \mu) \) if given any sequence \( \{s_n\} \) of polynomials converging to \( 0 \) in \( W^{k,p}(\Delta, \mu) \), then \( \{xs_n\} \) also converges to \( 0 \) in \( W^{k,p}(\Delta, \mu) \). In this case, if \( \{q_n\} \in P^{k,p}(\Delta, \mu) \), we define \( M(\{q_n\}) := \{xq_n\} \). If we choose another Cauchy sequence \( \{r_n\} \) representing the same element in \( P^{k,p}(\Delta, \mu) \) (i.e. \( \{q_n - r_n\} \) converges to \( 0 \) in \( W^{k,p}(\Delta, \mu) \)), then \( \{xq_n\} \) and \( \{xr_n\} \) represent the same element in \( P^{k,p}(\Delta, \mu) \) (since \( \{x(q_n - r_n)\} \) converges to \( 0 \) in \( W^{k,p}(\Delta, \mu) \)).

This definition is as natural as the following.

**Definition 13.** If \( \mu \) is a \( p \)-admissible vectorial measure (and hence \( W^{k,p}(\Delta, \mu) \) is a space of classes of functions), we say that the multiplication operator is well defined in \( W^{k,p}(\Delta, \mu) \) if given any function \( h \in V^{k,p}(\Delta, \mu) \) with \( \|h\|_{W^{k,p}(\Delta, \mu)} = 0 \), we have \( \|xh\|_{W^{k,p}(\Delta, \mu)} = 0 \). In this case, if \( [f] \) is an equivalence class in \( W^{k,p}(\Delta, \mu) \), we define \( M([f]) := [xf] \). If we choose another representative \( g \) of \( [f] \) (i.e. \( \|f - g\|_{W^{k,p}(\Delta, \mu)} = 0 \)) we have \( [xf] = [xg] \), since \( \|x(f - g)\|_{W^{k,p}(\Delta, \mu)} = 0 \).

The following result characterizes the spaces \( W^{k,p}(\Delta, \mu) \) with \( M \) well defined in the sense of Definition 13 [RARP2, Theorem 5.2].

**Theorem C.** Let us consider \( 1 \leq p < \infty \) and a \( p \)-admissible vectorial measure \( \mu \). Assume that \( xf \in V^{k,p}(\Delta, \mu) \) for every \( f \in V^{k,p}(\Delta, \mu) \). Then \( M \) is well defined in \( W^{k,p}(\Delta, \mu) \) if and only if \( K(\Delta, \mu) = \{0\} \).

Although both definitions are natural, it is possible for a \( p \)-admissible measure \( \mu \) with \( W^{k,p}(\Delta, \mu) = T \) (the closure of \( P \) is considered with the norm in \( W^{k,p}(\Delta, \mu) \)) that \( M \) is well defined in \( W^{k,p}(\Delta, \mu) \) and not well defined in \( P^{k,p}(\Delta, \mu) \) (see Corollary 4.4). The following lemma characterizes the spaces \( P^{k,p}(\Delta, \mu) \) with \( M \) well defined.

**Remark.** From now on we use Definition 12 instead of Definition 13.

**Lemma 4.1.** Let us consider \( 1 \leq p < \infty \) and \( \mu = (\mu_0, \ldots, \mu_k) \) a vectorial measure in \( \mathcal{M} \). The following facts are equivalent:

1. The multiplication operator is well defined in \( P^{k,p}(\Delta, \mu) \).
2. The multiplication operator is bounded in \( P^{k,p}(\Delta, \mu) \).

20
(3) There exists a positive constant $c$ such that
\[ \|q\|_{W^k,p(\Delta,\mu)} \leq c \|q\|_{W^k,p(\Delta,\mu)}, \quad \text{for every } q \in P. \]

**Remark.** When we say that the multiplication operator is bounded in $P^k,p(\Delta,\mu)$, we are assuming implicitly that it is well defined in $P^k,p(\Delta,\mu)$, since otherwise the boundedness has no sense.

**Proof.** It is clear that condition (3) implies (1). If we assume (1), we have that the multiplication operator $M$ is continuous in $0 \in (P, \| \cdot \|_{W^k,p(\Delta,\mu)})$. Since $M$ is a linear operator in the normed space $(P, \| \cdot \|_{W^k,p(\Delta,\mu)})$, we know that $M$ is bounded in $(P, \| \cdot \|_{W^k,p(\Delta,\mu)})$, which gives (3).

We now show the equivalence between (2) and (3). Let us consider an element $\gamma \in P^k,p(\Delta,\mu)$. This element $\gamma$ is an equivalence class of Cauchy sequences of polynomials under the norm in $W^k,p(\Delta,\mu)$. Assume that a Cauchy sequence of polynomials $\{q_n\}$ represents $\gamma$. The norm of $\gamma$ is defined as $\|\gamma\|_{P^k,p(\Delta,\mu)} = \lim_{n \to \infty} \|q_n\|_{W^k,p(\Delta,\mu)}$, which obviously does not depend on the representative chosen. Hence, condition (2) is equivalent to
\[ \lim_{n \to \infty} \|xq_n\|_{W^k,p(\Delta,\mu)} \leq c \lim_{n \to \infty} \|q_n\|_{W^k,p(\Delta,\mu)}, \]
for every Cauchy sequence of polynomials $\{q_n\}$. Now the equivalence between (2) and (3) is clear.

We now deduce the following particular case.

**Corollary 4.1.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a $p$-admissible vectorial measure in $\mathcal{M}$ with $W^k,p(\Delta,\mu) = P$. If the multiplication operator is well defined in $P^k,p(\Delta,\mu)$, then it is well defined and bounded in $W^k,p(\Delta,\mu)$.

**Lemma 4.2.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Then, the multiplication operator is bounded in $P^k,p(\Delta,\mu)$ if and only if there exists a positive constant $c$ such that
\[ \|q^{(j-1)}\|_{L^p(\Delta,\mu)} \leq c \|q\|_{W^k,p(\Delta,\mu)}, \]
for every $1 \leq j \leq k$ and $q \in P$.

**Proof.** If $M$ is bounded in $P^k,p(\Delta,\mu)$, we have that
\[ \|(xq)^{(j)}\|_{L^p(\Delta,\mu)} \leq \|M\| \|q\|_{W^k,p(\Delta,\mu)}, \]
for every $1 \leq j \leq k$ and $q \in P$. Since
\[ \|(xq)^{(j)}\|_{L^p(\Delta,\mu)} = \|xq^{(j)} + jq^{(j-1)}\|_{L^p(\Delta,\mu)} \geq \|q^{(j-1)}\|_{L^p(\Delta,\mu)} - K \|q^{(j)}\|_{L^p(\Delta,\mu)}, \]
with $K := \max \{|x| : x \in \Delta\}$, we have
\[ \|q^{(j-1)}\|_{L^p(\Delta,\mu)} \leq K \|q^{(j)}\|_{L^p(\Delta,\mu)} + \|M\| \|q\|_{W^k,p(\Delta,\mu)} \leq (K + \|M\|) \|q\|_{W^k,p(\Delta,\mu)}, \]
for every $1 \leq j \leq k$ and $q \in P$.

We now prove the converse implication. We have
\[ \|(xq)^{(j)}\|_{L^p(\Delta,\mu)} = \|xq^{(j)} + jq^{(j-1)}\|_{L^p(\Delta,\mu)} \leq j \|q^{(j-1)}\|_{L^p(\Delta,\mu)} + K \|q^{(j)}\|_{L^p(\Delta,\mu)}, \]
with $K := \max \{|x| : x \in \Delta\}$, for every $1 \leq j \leq k$ and $q \in P$. Then
\[ \|(xq)^{(j)}\|_{L^p(\Delta,\mu)} \leq 2^{p-1} \left( \|xq^{(j-1)}\|_{L^p(\Delta,\mu)} + K\|q^{(j)}\|_{L^p(\Delta,\mu)} \right) \]
\[ \leq 2^{p-1} \left( k^{p+1} \|q\|_{W^k,p(\Delta,\mu)} + K\|q\|_{W^k,p(\Delta,\mu)} \right), \]
for every $0 \leq j \leq k$ and $q \in P$ (if $j = 0$ the inequality is trivial). Consequently
\[ \|xq\|_{W^k,p(\Delta,\mu)} \leq 2^{p-1} \left( k^{p+1} \|q\|_{W^k,p(\Delta,\mu)} + K\|q\|_{W^k,p(\Delta,\mu)} \right), \]
and
\[ \|xq\|_{W^k,p(\Delta,\mu)} \leq 2^{(p-1)/p} \left( k^{p+1} \|q\|_{W^k,p(\Delta,\mu)} + K\|q\|_{W^k,p(\Delta,\mu)} \right), \]
for every $q \in P$. Hence, Lemma 4.1 gives that $M$ is bounded in $P^k,p(\Delta,\mu)$. \(\square\)
In the following we often use the next result. We omit the proof since it is elementary.

**Lemma 4.3.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$, $\mu' = (\mu'_0, \ldots, \mu'_k)$ vectorial measures in $\mathcal{M}$, with $\Delta = \bigcup_{j=0}^k \text{supp } \mu_j = \bigcup_{j=0}^k \text{supp } \mu'_j$. If the Sobolev norms in $W^{k,p}(\Delta, \mu)$ and $W^{k,p}(\Delta, \mu')$ are comparable on $P$, then:

1. $P^{k,p}(\Delta, \mu) = P^{k,p}(\Delta, \mu')$.
2. $M$ is bounded in $P^{k,p}(\Delta, \mu)$ if and only if it is bounded in $P^{k,p}(\Delta, \mu')$.

**Definition 14.** We say that a vectorial measure $\mu = (\mu_0, \ldots, \mu_k)$ belongs to the class $\text{ESD}$ if $d\mu_j = f_j \, d\mu_{j-1}$, with $f_j$ bounded for $1 \leq j \leq k$.

**Remark.** A vectorial measure $\mu$ is sequentially dominated if and only if $\mu \in \text{ESD}$ and $\text{supp } \mu_0 = \infty$. If $\mu \in \text{ESD}$, observe that $0$ is the unique polynomial $q$ with $\|q\|_{W^{k,p}(\Delta, \mu)} = 0$ if and only if $\text{supp } \mu_0 = \infty$.

**Theorem 4.1.** Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Then, the multiplication operator is bounded in $P^{k,p}(\Delta, \mu)$ if and only if there exists a vectorial measure $\mu' \in \text{ESD}$ such that the Sobolev norms in $W^{k,p}(\Delta, \mu)$ and $W^{k,p}(\Delta, \mu')$ are comparable on $P$. Furthermore, we can choose $\mu' = (\mu'_0, \ldots, \mu'_k)$ with $\mu'_j := \mu_j + \mu_{j+1} + \cdots + \mu_k$.

**Proof.** Assume that there exists a vectorial measure $\mu' \in \text{ESD}$ such that the Sobolev norms in $W^{k,p}(\Delta, \mu)$ and $W^{k,p}(\Delta, \mu')$ are comparable on $P$. By lemmas 4.2 and 4.3 it is enough to show

$$
\|q^{(j-1)}\|_{L^p(\Delta, \mu'_j)} \leq c \|q\|_{W^{k,p}(\Delta, \mu')},
$$

for every $1 \leq j \leq k$ and $q \in P$. The hypothesis $\mu' \in \text{ESD}$ gives

$$
\int |q^{(j-1)}|^p \, d\mu'_j = \int |q^{(j-1)}|^p f_j \, d\mu'_{j-1} \leq \|f_j\|_{\infty} \int |q^{(j-1)}|^p \, d\mu'_{j-1},
$$

where $\|f_j\|_{\infty} = \sup_{x \in \Delta} |f_j(x)|$, and then we have (4.1).

Assume now that $M$ is bounded in $P^{k,p}(\Delta, \mu)$. Let us consider the vectorial measures $\mu^0, \mu^1, \ldots, \mu^{k-1}, \mu^k$ defined by

$$
\mu^0_i := \mu_i, \quad \text{if } 0 \leq i < j,
$$

$$
\mu^k_i := \sum_{l=i}^k \mu_l, \quad \text{if } j \leq i \leq k.
$$

Observe that $\mu^k = \mu$ and $\mu^0$ is the measure $\mu'$ defined at the end of the statement of Theorem 4.1. These vectorial measures satisfy, for $0 \leq i \leq k$ and $0 < j \leq k$,

$$
\mu^j_i := \mu^1_i, \quad \text{if } i \neq j - 1,
$$

$$
\mu^j_{i-1} := \mu^0_i + \mu_{j-1} = \mu^0_i + \mu^1_{j-1}.
$$

Therefore we have $\|q\|_{W^{k,p}(\Delta, \mu^j)} \leq \|q\|_{W^{k,p}(\Delta, \mu^j-1)}$, for every $q \in P$ and $1 \leq j \leq k$.

Since $\mu^0 \in \text{ESD}$ it is enough to show that the Sobolev norms in $W^{k,p}(\Delta, \mu^k)$ and $W^{k,p}(\Delta, \mu^0)$ are comparable on $P$. We prove this by showing for $1 \leq j \leq k$ that the Sobolev norms in $W^{k,p}(\Delta, \mu^j)$ and $W^{k,p}(\Delta, \mu^{j-1})$ are comparable on $P$ and $M$ is bounded in $P^{k,p}(\Delta, \mu^{j-1})$. We prove this last statement by reverse induction on $j$.

If $j = k$, we have that $M$ is bounded in $P^{k,p}(\Delta, \mu^k)$, since $\mu^k = \mu$. Lemma 4.2 gives that

$$
\|q^{(k-1)}\|_{L^p(\Delta, \mu^k)} = \|q^{(k-1)}\|_{L^p(\Delta, \mu^k)} \leq c \|q\|_{W^{k,p}(\Delta, \mu^k)} = c \|q\|_{W^{k,p}(\Delta, \mu^k)},
$$

for every $q \in P$. This inequality and (4.3) give

$$
\|q^{(k-1)}\|_{L^p(\Delta, \mu^k)} \leq c^p \|q\|_{W^{k,p}(\Delta, \mu^k)} + \|q^{(k-1)}\|_{L^p(\Delta, \mu^{k-1})} \leq (c^p + 1) \|q\|_{W^{k,p}(\Delta, \mu^k)},
$$

for every $q \in P$. This inequality and (4.3) give

$$
\|q^{(k-1)}\|_{L^p(\Delta, \mu^k)} \leq c^p \|q\|_{W^{k,p}(\Delta, \mu^k)} + \|q^{(k-1)}\|_{L^p(\Delta, \mu^{k-1})} \leq (c^p + 1) \|q\|_{W^{k,p}(\Delta, \mu^k)},
$$

for every $q \in P$. This inequality and (4.3) give

$$
\|q^{(k-1)}\|_{L^p(\Delta, \mu^k)} \leq c^p \|q\|_{W^{k,p}(\Delta, \mu^k)} + \|q^{(k-1)}\|_{L^p(\Delta, \mu^{k-1})} \leq (c^p + 1) \|q\|_{W^{k,p}(\Delta, \mu^k)},
for every \( q \in P \). This fact and (4.2) show that the Sobolev norms in \( W^{k,p}(\Delta, \mu^k) \) and \( W^{k,p}(\Delta, \mu^{k-1}) \) are comparable on \( P \). Therefore Lemma 4.3 shows that \( M \) is bounded in \( P^{k,p}(\Delta, \mu^{k-1}) \), since it is bounded in \( P^{k,p}(\Delta, \mu^k) \).

Assume now that the induction hypothesis holds for \( j + 1 \). Then we have that \( M \) is bounded in \( P^{k,p}(\Delta, \mu^j) \). Lemma 4.2 shows that

\[
\| q^{(j-1)} \|_{L^p(\Delta, \epsilon_j')} \leq c \| q \|_{W^{k,p}(\Delta, \mu^j)},
\]

for every \( q \in P \). This inequality and (4.3) show

\[
\| q^{(j-1)} \|_{L^p(\Delta, \epsilon_{j-1}'')} \leq c^p \| q \|_{W^{k,p}(\Delta, \mu^j)} + \| q^{(j-1)} \|_{L^p(\Delta, \epsilon_{j-1}')} \leq (c^p + 1) \| q \|_{W^{k,p}(\Delta, \mu^j)},
\]

for every \( q \in P \). This fact and (4.2) show that the Sobolev norms in \( W^{k,p}(\Delta, \mu^j) \) and \( W^{k,p}(\Delta, \mu^{j-1}) \) are comparable on \( P \). Then Lemma 4.3 shows that \( M \) is bounded in \( P^{k,p}(\Delta, \mu^{j-1}) \), since it is bounded in \( P^{k,p}(\Delta, \mu^j) \).

This finishes the induction argument and the proof of Theorem 4.1. \[ \square \]

Obviously the best way to deduce that \( \mu \) and \( \mu' \) are equivalent is to prove that \( \mu' \) can be obtained by a finite number of completions of \( \mu \). In order to check this the following result is useful.

**Proposition 4.1.** Let us consider \( 1 \leq p < \infty \), a vectorial measure \( \mu \) and a fixed \( 0 < j \leq k \). Assume that \( \mu_j((a, b]) < \infty \), \( w_j := d\mu_j/dx \in B_p((a, b]) \), \( w_j \) is comparable to a monotone function in \( (a, a + \varepsilon) \) and \( (\mu_j)_1((a, a + \varepsilon]) = 0 \) for some \( \varepsilon > 0 \). Then \( \Lambda_p(\mu_j, \mu_j) < \infty \), where we are considering the interval \( (a, b] \) in the definition of \( \Lambda_p \).

**Remark.** The result is not true without the monotonicity hypothesis, even when \( \mu \) would be absolutely continuous, as is shown in the following example.

**Example.** For each \( 1 \leq p < \infty \) there exists a weight \( w \in L^\infty([a, b]) \cap B_p((a, b]) \) with \( \Lambda_p(w, w) = \infty \).

Without loss of generality we can assume that \( [a, b] = [0, 1] \). We give the example for \( 1 < p < \infty \). The case \( p = 1 \) is similar. Choose a sequence of positive numbers \( \{h_n\} \) growing to infinity with

\[
\lim_{n \to \infty} 2^{-2n} \left( \sum_{j=1}^{n} h_j 2^{-2j} \right)^{p-1} = \infty,
\]

and define

\[
w(x) := \begin{cases} 1, & \text{if } x \in (2^{-2n-1}, 2^{-2n}], \\ h_n^{-p}, & \text{if } x \in (2^{-2n}, 2^{-2n+1}]. \end{cases}
\]

It is immediate that

\[
\int_0^{2^{-2n}} w \geq 2^{-2n-1} \quad \text{and} \quad \int_{2^{-2n}}^{1} w^{-1/(p-1)} \geq \sum_{j=1}^{n} h_j 2^{-2j},
\]

and hence we have \( \Lambda_p(w, w) = \infty \) and \( w \in L^\infty([0, 1]) \cap B_p(0, 1) \).

**Proof.** We prove the case \( 1 < p < \infty \). The proof is similar in the case \( p = 1 \). If \( w_j \in B_p([a, b]) \) the result is immediate. Assume now that \( w_j \notin B_p([a, b]) \). Without loss of generality we can assume that \( w_j \) is a monotone function in \( (a, a + \varepsilon) \). We can assume also that \( w_j(a + \varepsilon) < \infty \), since otherwise we can take a smaller \( \varepsilon \). Then \( w_j \) is a non-decreasing function in \( (a, a + \varepsilon) \) and \( \lim_{x \to a^+} w_j(x) = 0 \), since otherwise \( w_j \notin B_p([a, b]) \). For \( a < r \leq a + \varepsilon \), if \( I := \int_{a+\varepsilon}^{b} w_j^{-1/(p-1)} \), we have that

\[
\mu_j ((a, r]) \left( \int_r^b w_j^{-1/(p-1)} \right)^{-p-1} = \left( \int_r^a w_j \left( \int_r^{a+\varepsilon} w_j^{-1/(p-1)} \right)^{-p-1} + I \right)^{-p-1} \leq (r - a)w_j(r)(a + \varepsilon - a)w_j(r)^{-1/(p-1)} + 1 \right)^{p-1} \leq \varepsilon (a + \varepsilon)^{1/(p-1)} I^{p-1}.
\]

For \( a + \varepsilon < r < b \),

\[
\mu_j ((a, r]) \left( \int_r^b w_j^{-1/(p-1)} \right)^{-p-1} \leq \mu_j ((a, b]) I^{p-1}.
\]

These two inequalities give \( \Lambda_p(\mu_j, \mu_j) < \infty \). \[ \square \]
The following result is very useful since in many cases it allows to reduce the study of the boundedness of $M$ in an abstract space $P^k,p(\Delta, m)$ to the study of the same property in $P^k,p(\Delta, \mu)$ with a $p$-admissible measure $\mu$. This has two advantages: the new space is a space of functions and there are results of boundedness for $M$ with $p$ $p$-admissible (see Theorem 4.3 below and [RARF2, section 5]).

**Theorem 4.2.** For $1 \leq p < \infty$, let us consider a finite $p$-admissible vectorial measure $\mu$ and a finite vectorial measure $\nu$ in the compact set $\Delta := \bigcup_{j=0}^{k} \text{supp } \mu_j$. Assume that $(\Delta, \mu) \in C_0$ and that $\text{supp } \nu_j$ is contained in a finite union of compact intervals $K_j$ for each $1 \leq j \leq k$. (The sets $\Omega^{(j)}$ are constructed with respect to $\mu$.) If the multiplication operator is bounded in $P^k,p(\Delta, \mu)$, then it is bounded in $P^k,p(\Delta, \mu + \nu)$.

**Proof.** We have that there is a positive constant $c$ such that

$$\|xq\|_{W^k,p(\Delta, \mu)} \leq c \|q\|_{W^k,p(\Delta, \mu)},$$

for every $q \in P$. Then, it is enough to show that for some positive constant $c$ we have

$$\|xq\|_{W^k,p(\Delta, \mu + \nu)} \leq c \|q\|_{W^k,p(\Delta, \mu + \nu)},$$

for every $q \in P$. Since $(xq)^{(j)} = xq^{(j)} + jsq^{(j-1)}$ and

$$\|xq^{(j)}\|_{L^p(\Delta, \nu_j)} \leq K \|q^{(j)}\|_{L^p(\Delta, \nu_j)} \leq K \|q\|_{W^k,p(\Delta, \mu + \nu)},$$

with $K := \max \{|x| : x \in \Delta\}$, it is enough to show that for some positive constant $c$ we have

$$\|q^{(j-1)}\|_{L^p(\Delta, \nu_j)} \leq c \|q\|_{W^k,p(\Delta, \mu + \nu)},$$

for every $1 \leq j \leq k$ and $q \in P$. The hypothesis on $\text{supp } \nu_j$, the finiteness of $\nu$ and Theorem A give

$$\|q^{(j-1)}\|_{L^p(\Delta, \nu_j)} \leq \|q^{(j-1)}\|_{L^p(K_{j-1}, \nu_j)} \leq c \|q^{(j-1)}\|_{L^\infty(K_{j-1})} \leq c \|q\|_{W^k,p(\Delta, \mu + \nu)},$$

for every $1 \leq j \leq k$ and $q \in P$. This finishes the proof of Theorem 4.2.

**Definition 15.** Let us consider a vectorial measure $\mu$ with absolutely continuous part $\omega$. We define the $p$-admissible part $\mu^a$ of $\mu$ by $d\mu^a := d(\mu)_\omega d|x| + w_j dx$ for $0 \leq j \leq k$ and $\Delta^a := \bigcup_{j=0}^{k} \text{supp } \mu^a_j$.

We have the following consequence of Theorem 4.2.

**Corollary 4.2.** For $1 \leq p < \infty$, let us consider a finite vectorial measure $\mu$ with $\Delta = \Delta^ad$ a compact set. Assume that $(\Delta, \mu^ad) \in C_0$ and that $\text{supp } (\mu^ad - (\mu^ad)^2)$ is contained in a finite union of compact intervals $K_j \subseteq \Omega^{(j)}$, for each $1 \leq j \leq k$. If the multiplication operator is bounded in $P^k,p(\Delta, \mu^ad)$, then it is bounded in $P^k,p(\Delta, \mu)$.

**Remark.** If $\Delta \neq \Delta^ad$, we can use localization results, such as theorems 4.9 and 4.10.

**Theorem 4.3.** Let us consider $1 \leq p < \infty$ and a finite vectorial measure $\mu$ with $\Delta$ a compact set. Assume that $(\Delta^ad, \mu^ad) \in C_0$ and that for each $1 \leq j \leq k$ we have $\mu_j(\Delta \setminus (J_{j-1} \cup K_{j-1})) = 0$, where $K_{j-1}$ is a finite union of compact intervals contained in $\Omega^{(j-1)}$, and $J_{j-1}$ is a measurable set with $d\mu_j = f_j d\mu_{j-1}$ in $J_{j-1}$ and $f_j$ bounded. Then the multiplication operator is bounded in $P^k,p(\Delta, \mu)$.

**Proof.** By Lemma 4.2 it is enough to show that there exists a positive constant $c$ such that

$$\|q^{(j-1)}\|_{L^p(\Delta, \mu^ad)} \leq c \|q\|_{W^k,p(\Delta, \mu)},$$

for every $1 \leq j \leq k$ and $q \in P$. We have by $\mu_j(\Delta) < \infty$ and Theorem A

$$\int_{K_{j-1}} |q^{(j-1)}|^p d\mu_j \leq c \|q^{(j-1)}\|_{L^\infty(K_{j-1})} \leq c \|q\|_{W^k,p(\Delta^ad, \mu^ad)} \leq c \|q\|_{W^k,p(\Delta, \mu)}.$$

The hypothesis on $J_{j-1}$ gives

$$\int_{J_{j-1}} |q^{(j-1)}|^p d\mu_j = \int_{J_{j-1}} |q^{(j-1)}|^p f_j d\mu_j - \leq c \int_{J_{j-1}} |q^{(j-1)}|^p d\mu_j - \leq c \|q\|_{W^k,p(\Delta, \mu)}.$$

These two inequalities and

$$\int |q^{(j-1)}|^p d\mu_j \leq \int_{K_{j-1}} |q^{(j-1)}|^p d\mu_j + \int_{J_{j-1}} |q^{(j-1)}|^p d\mu_j,$$

give the desired result for every $1 \leq j \leq k$ and $q \in P$. This finishes the proof of Theorem 4.3.
Theorem 4.4. Let us consider $1 < p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure such that $\Delta$ is a compact set and there exist $q_0 > 0$, $x_0 \in \mathbb{R}$ and $0 < k_0 \leq k$ with $\mu_j([x_0 - q_0, x_0 + q_0]) = 0$ for $k_0 < j \leq k$. Let us assume that $x_0$ is neither right nor left $(k_0 - 1)$-regular. If $\mu_{k_0}(\{x_0\}) > 0$ and $\mu_{k_0-1}(\{x_0\}) = 0$, then the multiplication operator is not bounded in $P^{k,p}(\Delta, \mu)$.

Proof. Assume that the multiplication operator is bounded in $P^{k,p}(\Delta, \mu)$. Lemma 4.2 gives that there exists a positive constant $c$ such that
\[
\|q^{(k_0-1)}\|_{L^p(\Delta, \mu_{k_0})} \leq c \|q\|_{W^{k,p}(\Delta, \mu)},
\]
for every $q \in P$. Consequentely, since $\mu_{k_0}(\{x_0\}) > 0$, we have that
\[
|q^{(k_0-1)}(x_0)| \leq c \|q\|_{W^{k,p}(\Delta, \mu)},
\]
for every $q \in P$, but this is a contradiction with Theorem 3.3.

Theorem 4.5. Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \mathbb{R}$, $c > 0$, $0 \leq k_0 < k$ and an open neighbourhood $U$ of $x_0$ such that
\[
d_{\mu_j+1}(x) \leq c|x - x_0|^p d_{\mu_j}(x),
\]
for $x \in U \setminus \{x_0\}$ and $k_0 \leq j < k$. If there exists $i > k_0$ with $\mu_i(\{x_0\}) > 0$ and $\mu_{i-1}(\{x_0\}) = 0$, then the multiplication operator is not bounded in $P^{k,p}(\Delta, \mu)$.

Proof. Let us consider the vectorial finite measure $\nu = (\nu_0, \ldots, \nu_k)$ defined as follows: $\nu_j := 0$ for $0 \leq j < k_0$ and $\nu_j := \mu_j|_{\{x_0\}}$ for $k_0 \leq j \leq k$. The measure $\nu' := \mu - \nu$ satisfies $\mu_{k_0}(\{x_0\}) = 0$ and
\[
d_{\mu_j+1}(x) \leq c|x - x_0|^p d_{\mu_j}(x),
\]
for $x \in U$ and $k_0 \leq j < k$. Then Theorem 3.1 shows that there exists a sequence of polynomials $\{r_n\}$ such that
\[
\lim_{n \to \infty} \|r_n\|_{W^{k,p}(\Delta, \mu')} = 0,
\]
and
\[
r_n(x_0) = 0 \text{ for } 0 \leq n \leq k_0 - 1 \leq k.
\]
We have $\lim_{n \to \infty} \|r_n\|_{W^{k,p}(\Delta, \mu)} = 0$, by $\mu_{i-1}(\{x_0\}) = 0$ and conditions (1) and (3); conditions (2) and (3) give that
\[
\lim_{n \to \infty} \|sr_n\|_{W^{k,p}(\Delta, \mu)} \geq \mu_i(\{x_0\}) \frac{1}{p} \lim_{n \to \infty} |x_0 r_n^{(i)}(x_0) + i r_n^{(i-1)}(x_0)| = i \mu_i(\{x_0\}) \frac{1}{p} > 0.
\]
These two facts show that the multiplication operator is not bounded in $P^{k,p}(\Delta, \mu)$.

As a particular case we obtain

Corollary 4.3. Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \mathbb{R}$, an open neighbourhood $U$ of $x_0$ and $0 \leq k_0 < k$ with $\mu_j(U \setminus \{x_0\}) = 0$ for $k_0 < j \leq k$. If there exists $i > k_0$ with $\mu_i(\{x_0\}) > 0$ and $\mu_{i-1}(\{x_0\}) = 0$, then the multiplication operator is not bounded in $P^{k,p}(\Delta, \mu)$.

The following is a modification of the Muckenhoupt inequality, which can be proved by similar arguments.

Lemma 4.4. Let us consider $1 \leq p < \infty$ and $\mu_0, \mu_1$ finite measures in $[a, b]$ with $w_1 := d\mu_1/dx$. Assume that there exists a positive constant $c_0$ with
\[
\left\| \int_a^b g(t) \, dt \right\|_{L^p([a,b], \mu_0)} \leq c_0 \|g\|_{L^p([a,b], \mu_1)},
\]
for any function $g$ in $C^\infty_c((a,b))$. Then we have
\[
\sup_{a < r < b} \mu_0([a,r]) \|w_1^{-1}\|_{L^1([r,b])} \leq c_0^p.
\]
Theorem 4.6. Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $0 < k_0 \leq k$, $\alpha \in \mathbb{R}$ and $\varepsilon > 0$ with

\begin{align}
(1) & \quad \lim_{\alpha \to \infty} \sup_{\alpha < r < \alpha + \varepsilon} \mu_0((x, r)) \left( \frac{d\mu_0}{dx}(r) \right)^{-\frac{1}{p-1}} \parallel 1_{L^{1/p-1}(\mu_0)} \parallel \to 0, \\
(2) & \quad \parallel \int_{\alpha}^{\alpha+\varepsilon} \mu_0((x, r)) \left( \frac{d\mu_0}{dx}(r) \right)^{-\frac{1}{p-1}} \parallel 1_{L^{1/p-1}(\mu_0)} \parallel \parallel g \parallel_{L^p((\alpha, \alpha + \varepsilon), \mu_0)} = 0, \\
(3) & \quad \# \supp(\mu_j((\alpha + \varepsilon))) < \infty, \quad \text{for } k_0 < j \leq k \quad \text{(if } k_0 < k). \tag{3}
\end{align}

Then the multiplication operator is not bounded in $L^p(\Delta, \mu)$.

**Remark.** A similar result holds for $[\alpha - \varepsilon, \alpha]$ instead of $[\alpha, \alpha + \varepsilon]$.

**Proof.** By Lemma 4.4 and hypothesis (1) we know that there exist functions $g_n \in C_c^\infty((\alpha, \alpha + \varepsilon))$ such that

\[
\lim_{n \to \infty} \parallel \int_{\alpha}^{\alpha+\varepsilon} g_n(t) \parallel_{L^p((\alpha, \alpha + \varepsilon), \mu_0)} = 0.
\]

If we define $\nu = (\nu_0, \ldots, \nu_k)$ by $\nu_j := \mu_j$ for $0 \leq j \leq k_0$ and $\nu_j := \mu_j|_{(\alpha, \alpha + \varepsilon)}$ for $k_0 < j \leq k$ (if $k_0 < k$), and

\[
G_n(x) := \int_{\alpha}^{x} g_n(t) \frac{(x - t)^{k_0-1}}{(k_0 - 1)!} \, dt,
\]

hypothesis (2) gives

\[
\parallel G_n \parallel_{W^{k,p}(\Delta, \nu)} \leq \sum_{j=0}^{k_0} \parallel G_n^{(j)} \parallel_{L^p((\alpha, \alpha + \varepsilon), \mu_0)} \leq c_0 \parallel g_n \parallel_{L^p((\alpha, \alpha + \varepsilon), \mu_0)}.
\]

Then we have

\[
\lim_{n \to \infty} \inf \parallel G_n^{(k_0-1)} \parallel_{L^p((\alpha, \mu_0))} \geq \lim_{n \to \infty} \frac{\parallel \int_{\alpha}^{\alpha+\varepsilon} g_n(t) \parallel_{L^p((\alpha, \alpha + \varepsilon), \mu_0)}}{c_0 \parallel g_n \parallel_{L^p((\alpha, \alpha + \varepsilon), \mu_0)}} = \infty.
\]

Since $\Delta$ is compact, Bernstein’s proof of the Weierstrass Theorem shows that we can approximate $G_n$ by polynomials with the norm

\[
\parallel f \parallel_{A} := \sum_{j=0}^{k} \parallel f^{(j)} \parallel_{L^\infty(\Delta)},
\]

and hence with the norm

\[
\parallel f \parallel_{B} := \parallel f \parallel_{W^{k,p}(\Delta, \nu)} + \parallel f^{(k_0-1)} \parallel_{L^p((\alpha, \mu_0))},
\]

since $\mu$ and $\nu$ are finite. Consequently there exists a sequence of polynomials $\{g_n\}$ with

\[
\lim_{n \to \infty} \frac{\parallel f_n^{(k_0-1)} \parallel_{L^p((\alpha, \mu_0))}}{\parallel g_n \parallel_{W^{k,p}(\Delta, \nu)}} = \infty.
\]

If $k_0 < k$, by hypothesis (3) we can consider

\[
\{x_1, \ldots, x_m\} = \bigcup_{j=k_0+1}^{k} \supp(\mu_j((\alpha, \alpha + \varepsilon)))
\]

If we apply Corollary 3.3 $m$ times we obtain that there exists a sequence of polynomials $\{r_n\}$ with

\[
\lim_{n \to \infty} \frac{\parallel f_n^{(k_0-1)} \parallel_{L^p((\alpha, \mu_0))}}{\parallel r_n \parallel_{W^{k,p}(\Delta, \nu)}} = \infty,
\]

and $r_n^{(j)}(x_i) = 0$ for $k_0 < j \leq k$ and $1 \leq i \leq m$. Therefore

\[
\lim_{n \to \infty} \frac{\parallel r_n^{(k_0-1)} \parallel_{L^p((\alpha, \mu_0))}}{\parallel r_n \parallel_{W^{k,p}(\Delta, \nu)}} = \infty.
\]

Now Lemma 4.2 finishes the proof.
Corollary 4.4. Given \( a, b \in \mathbb{R}, \ a < b \) and \( 1 \leq p < \infty \), there exists a \( p \)-admissible vectorial measure \( \mu \) such that \( P \) is dense in \( W^{k,p}([a,b],\mu) \), \( M \) is well defined in \( W^{k,p}([a,b],\mu) \) and it is not well defined in \( P^{k,p}([a,b],\mu) \).

**Proof.** Fix \( c \in (a,b) \) and define the absolutely continuous vectorial measure \( \mu \) as follows: \( w_j := 1 \) in \((c,b]\) for \( 0 \leq j \leq k \), \( w_j := 0 \) in \([a,c[, \) for \( 0 \leq j < k \), and \( w_j \) is a weight in \([a,c]\) as in the example after Proposition 4.1. \( \mu \) is a \( p \)-admissible measure since it is absolutely continuous. \( \mu \) is bounded in \( \mathbb{R} \). Theorem C shows that \( \mu \) is well defined in \( W^{k,p}([a,b],\mu) \). Theorem 4.6 with \( k_0 = k \) and \([a,\alpha + \varepsilon] = [a,c]\) shows that \( M \) is not bounded in \( P^{k,p}([a,b],\mu) \); hence it is not well defined in \( P^{k,p}([a,b],\mu) \) by Lemma 4.1. Finally, Theorem 3.1 in [R] shows that \( P \) is dense in \( W^{k,p}([a,b],\mu) \), since \( w_k \in B_p((a,b)) \).

We present here a case in which the condition \( \mu \in ESD \) is equivalent to \( M \) bounded.

**Theorem 4.7.** Let us consider \( 1 \leq p < \infty \) and \( \mu = (\mu_0,\ldots,\mu_k) \) a finite vectorial measure with \( \Delta \) a compact set. Assume that \# supp \( \mu_j < \infty \) for \( 1 \leq j \leq k \). Then, the multiplication operator is bounded in \( P^{k,p}(\Delta,\mu) \) if and only if \( \mu \in ESD \).

**Proof.** Let us assume that \( \mu \notin ESD \). Then there exist \( x_0 \in \Delta \) and \( 0 < i \leq k \) such that \( \mu_i(\{x_0\}) > 0 \) and \( \mu_{i-1}(\{x_0\}) = 0 \), since \# supp \( \mu_j < \infty \) for \( 1 \leq j \leq k \). This hypothesis also shows that there exists a neighbourhood \( U \) of \( x_0 \) with \( \mu_j(U \setminus \{x_0\}) = 0 \) for \( 1 \leq j \leq k \). Then Corollary 4.3 with \( k_0 = 0 \) gives that the multiplication operator is not bounded in \( P^{k,p}(\Delta,\mu) \).

If \( \mu \in ESD \), then the proof of Theorem 4.1 shows that \( M \) is bounded in \( P^{k,p}(\Delta,\mu) \).

Theorem C shows that the condition \( K(\Delta,\mu) \neq \{0\} \) implies that \( M \) is not bounded in \( P^{k,p}(\Delta,\mu) \) for \( p \)-admissible measures \( \mu \) with \( W^{k,p}(\Delta,\mu) = \mathcal{P} \). If \( \mu \) is not \( p \)-admissible, we can apply the following result.

**Theorem 4.8.** Let us consider \( 1 \leq p < \infty \), \( \mu = (\mu_0,\ldots,\mu_k) \) a finite vectorial measure with \( \Delta \) a compact set and a connected component \((\alpha,\beta)\) of \( \Omega_1 \cup \cdots \cup \Omega_k \). Assume that \( \mu_0(\{\alpha\}) = \mu_0(\{\beta\}) = 0 \), \( \mu = \mu^{ad} \) in \([\alpha,\beta], \ K(\alpha,\beta,\mu) \neq \{0\} \), and that there exist \( c, \varepsilon > 0 \) with

\[
\begin{align*}
    d\mu_{j+1}(x) &\leq c|x - \alpha|^p d\mu_j(x), & x &\in [\alpha - \varepsilon, \alpha],
    \\
    d\mu_{j+1}(x) &\leq c|x - \beta|^p d\mu_j(x), & x &\in [\beta, \beta + \varepsilon],
\end{align*}
\]

for \( 0 \leq j < k \). Then \( M \) is not bounded in \( P^{k,p}(\Delta,\mu) \).

**Proof.** Let us consider a function \( q \in K(\alpha,\beta,\mu) \) which is not identically zero. It is easy to see that \( q \in \mathcal{P}_{k-1} \) (see the arguments in the proof of Proposition 3.1). Without loss of generality we can assume that \( \operatorname{deg} q = \max \{ \operatorname{deg} r : r \in K(\alpha,\beta,\mu) \} \). Then we have \( \|q\|_{W^{k,p}(\alpha,\beta,\mu)} = 0 \) and \( \|xq\|_{W^{k,p}(\alpha,\beta,\mu)} > 0 \), since \( xq \notin K(\alpha,\beta,\mu) \). The hypotheses and Lemma 3.1 show that there exist \( g_n \in C_c^\infty(\mathbb{R}) \) with

\[
\lim_{n \to \infty} \|g_n\|_{W^{k,p}(\Delta,\mu)} = \|q\|_{W^{k,p}(\alpha,\beta,\mu)} = 0 \quad \text{and} \quad \|xg_n\|_{W^{k,p}(\Delta,\mu)} \geq \|xq\|_{W^{k,p}(\alpha,\beta,\mu)} > 0,
\]

(it is enough to multiply \( q \) by functions in \( C_c^\infty(\mathbb{R}) \) with value 1 in \([\alpha,\beta] \), as in the proof of Theorem 3.1). The proof is finished since \( g_n \) and its derivatives can be approximated uniformly by polynomials.

We also have localization results for the multiplication operator.

**Theorem 4.9.** Let us consider \( 1 \leq p < \infty \) and \( \mu = (\mu_0,\ldots,\mu_k) \) a finite vectorial measure with \( \Delta \) a compact set. Assume that for every \( x_0 \in \Delta \) there exist \( \varepsilon, c > 0 \) (which can depend on \( x_0 \)) such that

\[
\|xq\|_{W^{k,p}([x_0-\varepsilon,x_0+c],\mu)} \leq c \|q\|_{W^{k,p}([x_0-\varepsilon,x_0+c],\mu)},
\]

for every \( q \in P \). Then the multiplication operator is bounded in \( P^{k,p}(\Delta,\mu) \).

The proof of this result is immediate. We have a partial converse of Theorem 4.9.
Theorem 4.10. Let us consider $1 \leq p < \infty$ and $\mu = (\mu_0, \ldots, \mu_k)$ a finite vectorial measure with $\Delta$ a compact set. Assume that there exist $x_0 \in \Delta$ and $\varepsilon_0 > 0$ with $\mu_{[x_0-\varepsilon_0,x_0+\varepsilon_0]}$ $p$-admissible and $(x_0-\varepsilon_0,x_0+\varepsilon_0,\mu) \in C_0$. If the multiplication operator is bounded in $P^{k,p}(\Delta,\mu)$, then for each $0 < \varepsilon < \varepsilon_0$ there exists $c > 0$ such that

$$\|xg\|W^{k,p}([x_0-\varepsilon,x_0+\varepsilon],\mu) \leq c \|g\|W^{k,p}([x_0-\varepsilon_0,x_0+\varepsilon_0],\mu),$$

for every $g \in P$. 

Proof. Let us fix $0 < \varepsilon < \varepsilon_0$. We can choose compact intervals $J_1 \subseteq [x_0-\varepsilon_0,x_0-\varepsilon]$, $J_2 \subseteq [x_0+\varepsilon_0,x_0+\varepsilon]$ and integers $0 \leq k_1, k_2 \leq k$ satisfying for $m = 1, 2$, $J_m \subseteq \Omega^{(k_m-1)}$, if $k_m > 0$, and $\mu_j(J_m) = 0$ for $k_m < j \leq k$, if $k_m < k$. If $K := J_1 \cup J_2$, we have $\mu_j(K) < \infty$ for $0 \leq j \leq k$, since $\mu$ is finite.

Take a fixed function $\varphi \in C_\infty([x_0-\varepsilon_0,x_0+\varepsilon_0])$ with $0 \leq \varphi \leq 1$, $\varphi = 1$ in $[x_0-\varepsilon, x_0+\varepsilon]$ and supp $\varphi' \subseteq K$. Theorem 3.2 shows that there exists a positive constant $c$ such that

$$\|\varphi g\|W^{k,p}(\Delta,\mu) \leq c \|g\|W^{k,p}(\Delta,\mu),$$

for every $g \in C^k(\mathbb{R})$. Since $\Delta$ is a compact set, Bernstein’s proof of the Weierstrass Theorem gives that $\|\varphi g\|W^{k,p}(\Delta,\mu) \leq \|M\| \|g\|W^{k,p}(\Delta,\mu)$, for every $g \in C^k(\mathbb{R})$. Consequently, $\varphi = 1$ in $[x_0-\varepsilon, x_0+\varepsilon]$ and (4.4) give

$$\|xg\|W^{k,p}([x_0-\varepsilon,x_0+\varepsilon],\mu) \leq \|x\varphi g\|W^{k,p}([x_0-\varepsilon,x_0+\varepsilon],\mu) \leq \|M\| \|\varphi g\|W^{k,p}(\Delta,\mu) \leq c \|g\|W^{k,p}([x_0-\varepsilon_0,x_0+\varepsilon_0],\mu),$$

for every $g \in P$. This finishes the proof of Theorem 4.10. \qed

Theorem 4.10 is not true without the hypothesis $([x_0-\varepsilon_0,x_0+\varepsilon_0],\mu) \in C_0$, as is shown by the following example.

Example. Let us consider the vectorial measure $\mu = (\mu_0, \ldots, \mu_k)$ with $d\mu_0 := \chi_{[0,1]||2,3|}dx$, $d\mu_k := \chi_{[0,3]}dx$, and $\mu_j := 0$ for $0 < j < k$ if $k > 1$. Theorems 5.1 and 5.2 in [RARP2] show that $M$ is bounded in $W^{k,p}([0,3],\mu)$, since $\mu$ is a measure of type 1 in $[0,3]$ (see Definition 10 in [RARP2]) and $\mathcal{K}([0,3],\mu) = \{0\}$. However, for $q(x) := x^{k-1}$ we have for any $0 < \eta < 1/2$, $\|q\|W^{k,p}([1+\eta,2-\eta],\mu) = \|k\|L^p([1+\eta,2-\eta]) > 0$ and $\|q\|W^{k,p}([1,2],\mu) = 0$.
